III	Industrial Aggregate and Manufacturing Industry	Census Metropolitan Areas	28

Estimated Number of Employees Paid by the Hour

Average Hourly Earnings and Weekly Hours for Employees Paid by the Hour

IV	Major Industries (12)	Canada and Provinces	36
V	Manufacturing Industry	Census Metropolitan Areas	72
VI	<u>Adjustment Factors for Comparing 1987, 1988 and current Estimates with earlier years</u>		78

Note: Also available on request are the 1983-1986 Annual Averages and Time Series report, as well as the 1987 and 1988 Annual Averages and Monthly Estimates report.

NOTE ON COEFFICIENT OF VARIATION (C.V.)

The Coefficient of Variation (C.V.) is presented in order to assist the user in judging the quality of the estimates.

The sample estimate and its standard error (derived from the coefficient of variation) may be used to construct an interval within which the unknown census value is expected to be contained with a prescribed confidence. For example: if the estimate of the number of employees is 1,000 and the coefficient of variation is 2.0%, then the standard error of the estimate is 20 (2.0% of 1,000); therefore, it can be said that 95 times out of 100, the true value, had a census been taken, would be in the interval between 960 and 1,040 (twice the standard error below and above the estimate).

Users should therefore be wary of estimates with high standard errors or with coefficients of variation which change significantly from month-to-month; this is a clear indication that the sample is changing and that the monthly movements should be interpreted with caution.

Note that for Public Administration (SIC 909-951), every unit is selected on a monthly basis (Take-All Units). The sampling error associated with the series is nil and the coefficient of variation is therefore zero.

NOTE: CV% = Coefficient of variation

Some industries may not appear due to confidentiality or data too small to be expressed

Employment figures are simple averages while those for earnings are weighted

All earnings include overtime

* Adjustments to data for the period 1983 to 1986 are usually required
when making comparisons with 1987 and later estimates.

NOTE: CV% = Coefficient of variation

Some industries may not appear due to confidentiality or data too small to be expressed

Employment figures are simple averages while those for earnings and hours are weighted

All earnings and hours include overtime

* Adjustments to data for the period 1983 to 1986 are usually required

when making comparisons with 1987 and later estimates.

SECTION VI

Note on Adjustment Factors
for Comparing 1987, 1988 and/or 1989 Estimates with Earlier Years

In January 1987, the Survey of Employment, Payrolls and Hours (SEPH) introduced changes to their sampling frame. It is therefore necessary to adjust for the frame changes when comparing 1987, 1988 and/or 1989 data to 1986 and earlier years. Adjustment factors have been derived for this purpose and are presented in the tables following this note. Adjustment factors for the Census Metropolitan Areas are not available.

For more information see the May 1987 issue of Employment, Earnings and Hours Catalogue No. 72-002.

How to use the factors

Data for 1986 or earlier years must be multiplied by the factor shown in the accompanying tables when making comparisons to 1987, 1988 and/or 1989 estimates.

(Note for each industry, variable, geography and type of units a separate factor applies).

To calculate the adjusted estimates simply multiply the 1986 or earlier estimate by the factor; this effectively adjusts the data for the frame changes and allows direct comparison to the 1987, 1988 and/or 1989 data.

The following example demonstrates the use of the factors:

What has been the change in employment in the industrial aggregate for all employees in all sizes of firms between April 1986 and April 1987?

Identify the industry code(s)

- the industry codes for the industrial aggregate are 031-951;

Identify the variable(s)

- the variable is total employees
- the geographical area is Canada
- for all sizes of firms

Calculate the adjusted estimate

- multiplying the April 1986 estimate of employment by the factor we get:

$$9,056.6 \text{ thousand} \times 1.0575 = 9,577.4 \quad (\text{adjusted data})$$

This figure can now be compared to the April 1987 estimate of 9,796.2 thousand thus showing an increase in employment of 218.8 thousand or 2.3%.

If you experience any difficulty in using the factors or require more information on the technique used in deriving them, please contact the Labour Division for assistance.
