SIGNE CONVENTIONNEL

- nul ou zéro

The purpose of this paper is to provide historical series for the revised estimates which were expanded in January 1969 to give complete coverage of the non-agricultural sector. The note which follows describes the additions to the estimates which have been made over the past several years, the definitions used, and the changes made in automating the small firm sample survey.

X Data appearing in the tables supersede those published previously in the DBS report "Estimates of Employees by Province and Industry" catalogue no. 72-008.

Coverage

The estimates are produced by combining data from a variety of sources. The largest single source is the monthly employment and payrolls survey of establishments employing 20 or more persons in any one month of the year. Data from this survey are compiled in extensive industry and area detail, and include average hours and earnings figures as well as employment indexes.(1) The survey does not cover employees in agriculture, public administration and defence and the education, health and welfare and religion groups in service(2). Establishments employing fewer than 15 employees are asked to report employment data only, and are sampled on a rotational basis. This survey was fully automated in May 1968, and the sample design changed with a resultant increase in the amount of industry and area detail available, as described below. The additional detail was included for the first time in the January 1969 estimates, but sampling still limits the estimates to considerably less detail than is available from the large firm survey. The third main source of data is a complete survey of employment in establishments with 15-19 employees. Coverage in these latter two surveys is basically restricted to the same industries as the large firm survey.

Exclusions from the three sources mentioned above have necessitated supplemental coverage in certain industries. Employment in non-commercial service is compiled from independent surveys established over the 1965 to 1968 period. Hospitals across Canada have been reporting employment data on a monthly basis since January 1965 and school boards since May 1965. Beginning in January and February 1966, the survey of education was extended in stages to cover universities and colleges, teachers' colleges, private schools, trade schools, nursery schools, institutes of technology, business colleges, schools for the handicapped, libraries and museums and miscellaneous educational services. Complete data for hospitals and education and related service were included in the estimates in February 1968. The survey of welfare organizations, comprising groups such as convalescent and rest homes not providing treatment services, orphanages, homes for the aged, children's aid societies, voluntary welfare organizations, Canadian National Institute for the Blind and the Canadian Welfare Council, was established in July 1967. An annual survey of religious organizations was initiated in January 1968. Offices of physicians and dentists are included in the small firm sample survey. With the inclusion of estimates of employment in private households from the Labour Force survey, along with the data for welfare and religious organizations, coverage of non-commercial service was complete in January 1969. Data for the period before initiation of these surveys were estimated using Census and other data.

 (2) As defined in the "Standard Industrial Classification Manual" cat. 12-501, 1960.

Le présent bulletin donne la série chronologique des estimations révisées dont le champ a été étendu en janvier 1969 à la totalité du secteur non agricole. Le texte ci-dessous décrit les adjonctions faites à ces estimations au cours des dernières années, les définitions employées et les transformations découlant de l'automatisation de l'enquête sur les petits établissements.

Les statistiques des tableaux annulent et remplacent celles qui ont été publiées antérieurement dans le bulletin du B.F.S. intitulé Estimates of Employees by Province and Industry, n° de catalogue 72-008.

Champ

Les estimations se fondent sur des statistiques provenant de diverses sources. La source la plus importante est l'enquête mensuelle sur l'effectif et les frais salariaux des établissements occupant 20 personnes et plus au cours d'un mois quelconque de l'année. La ventilation sectorielle et territoriale des statistiques obtenues grâce à cette enquête est très poussée. On y trouve aussi les moyennes des heures de travail et les gains moyens ainsi que les indices de l'emploi(1). L'enquête ne comprend pas les employés de l'agriculture, de l'administration publique et de la défense nationale ni des services suivants: enseignement, santé et œuvres sociales et organismes religieux(2). D'autre part, les établissements ayant moins de 15 employés ne sont tenus qu'à la déclaration du nombre de personnes employées. Ils sont soumis à un sondage tournant. L'enquête a été entièrement automatisée en mai 1968. On a alors modifié la structure de l'échantillon ce qui se traduit par une plus grande finesse tant sectorielle que territoriale, comme nous allons le voir ci-dessous. Les nouveaux détails ont été intégrés dès les estimations de janvier 1969 mais, en raison du sondage, la finesse des estimations est encore nettement inférieure à celle de l'enquête sur les grandes entreprises. La troisième source importante de statistiques est le recensement du nombre de personnes employées dans les établissements ayant de 15 à 19 employés. Le champ de ces deux dernières enquêtes est essentiellement limité aux mêmes activités économiques que l'enquête sur les grandes entreprises.

Etant donné les exclusions auxquelles les trois sources mentionnées ci-dessus donnent lieu, il a fallu compléter les renseignements dans certains secteurs. La statistique de l'emploi dans les services non commerciaux a été établie à partir d'enquêtes distinctes effectuées entre 1965 et 1968. Tous les hôpitaux canadiens déclarent le nombre de personnes employées annuellement depuis janvier 1965 et les commissions scolaires le font depuis mai 1965. Depuis janvier et février 1968, l'enquête sur l'éducation a été étendue graduellement aux universités et collèges, écoles normales, écoles privées, écoles de métiers, écoles maternelles, instituts de technologie, collèges commerciaux, écoles pour handicapés, bibliothèques, musées et aux divers services éducatifs. Les estimations de février 1968 comprenaient des statistiques complètes des hôpitaux et de l'éducation ainsi que des services connexes. L'enquête sur les organismes d'assistance sociale visant les maisons de repos et de convalescence ne prodigant pas de soins, les orphelinats, les foyers pour les vieillards, les sociétés d'aide à l'enfance, les organisations bénévoles de charité, l'Institut national canadien pour les aveugles et le Conseil canadien du bien-être a été instituée en juillet 1967. Une enquête annuelle sur les organismes religieux a été lancée en janvier 1968. L'enquête-échantillon sur les petites entreprises comprend les bureaux de médecin et de dentiste. Grâce à l'inclusion des estimations du nombre de personnes employées dans les ménages privés, tirées du relevé de la main-d'œuvre, ainsi que des statistiques sur les organismes religieux et d'assistance sociale, le champ des services non commerciaux se trouvait entièrement couvert en janvier 1969. Les statistiques de la période-antérieure ont été estimées à partir des renseignements provenant du recensement ainsi que d'autres sources.

 (2) Suivant la définition du Manuel de la classification typique des industries, n° de catalogue 12-501F, 1963.

Employment data for public administration and defence are obtained from information already reported to the Governments Division of the Bureau of Statistics. These data exclude non-civilian employees and government agencies that are classified to other industry divisions. Data for federal and provincial government employees except for provincial government employees in British Columbia were first included in the estimates in February 1968. In January 1969 the coverage of public administration and defence was completed using a sample for estimating municipal government employees and various published information for estimating employment with the B.C. government.

Estimates of employment in fishing and trapping are derived from the monthly Labour Force household survey. While too small to be shown separately, these estimates were included in the total in January 1969.

With the additions made in January 1969, the estimates of employees covered the whole non-agricultural sector of the economy.

Definitions

As has been indicated above, the estimates are based almost entirely on surveys of establishments. The establishment is defined as the smallest industrial unit which is a separate operating entity capable of reporting all elements of basic industrial statistics. The data in the main refer to the last week in the specified month(3), and include employees who are paid for rendering current services or are on paid absence during that period. Excluded are proprietors, directors and firm members including those who are actively engaged in the operation of the firm, pensioners, own-account workers, unpaid family workers, employees working less than the equivalent of one full day in the week, employees absent without pay and persons providing services to the establishment on a contract basis.

Redesign of the Small Firm Sample Survey

The small firm survey was completely automated in May 1968. The first stage in the conversion to an automated system was to establish on magnetic tapes a complete, up-to-date file of establishments employing fewer than 20 persons. The tape file contains approximately 300,000 such establishments, of which about 3,500 employ between 15-19 persons.

The sample is based on a stratification by area and industry. Establishments on the tape file are divided among 16 geographic strata (the metropolitan areas of Montreal, Toronto, Winnipeg and Vancouver, the provinces and territories) and among 17 industry strata (for specified major groups within 8 industry divisions). Thus the population is stratified into 272 strata based on location and industry. Establishments in a stratum are assigned at random to panels and the sample is based on a selected number of panels in a stratum. A number of strata are small and all reporting units are asked to respond monthly. Some strata are considered too small for sample rotation and a fixed number of panels are always in the sample.

The 'rotating' strata contain a minimum of 16 panels of which 8 are in sample each month. One new panel enters the sample each month and the panel which has been in the sample for 8 months rotates out. As a result, the sample rotates systematically through

Les statistiques sur l'emploi dans l'administration publique et la défense nationale proviennent de renseignements déjà recueillis par la Division des gouvernements du Bureau fédéral de la statistique. En sont exclus les employés non civils et les organismes du gouvernement classés sous d'autres rubriques sectorielles. Les statistiques sur les employés des gouvernements fédéral et provinciaux, sauf les employés provinciaux de la Colombie-Britannique, ont figuré pour la première fois dans les estimations de février 1968. En janvier 1969, le champ de l'administration publique et de la défense nationale était couvert en totalité. On a eu recours au sondage pour les employés des municipalités et on s'est servi de divers renseignements publiés pour l'estimation de l'emploi du gouvernement de la Colombie-Britannique.

Les estimations concernant l'emploi dans les secteurs de la pêche et du piégeage proviennent de l'enquête mensuelle sur la population active (main-d'œuvre) effectuée auprès des ménages. Ces chiffres estimatifs sont trop faibles pour qu'on puisse les donner isolément, mais on les a inclus dans le total du Canada de janvier 1969.

Grâce aux compléments de janvier 1969, les estimations couvrent la totalité des employés du secteur non agricole de l'économie.

Définitions

Comme on vient de le voir, les estimations se fondent presque entièrement sur les enquêtes dans les établissements. On définit l'établissement comme la plus petite unité industrielle formant une entité fonctionnelle distincte pouvant fournir tous les renseignements élémentaires servant aux statistiques sur l'industrie. En général, les renseignements déclarés sont ceux de la dernière semaine du mois intéressé(3); et portent sur les employés payés dans l'exercice de leurs fonctions pendant la semaine de la déclaration et sur les employés absents payés durant cette période. Sont exclus les propriétaires, les directeurs et les membres de la société participant activement à l'exploitation de la société, les bénéficiaires de pensions, les travailleurs à leur compte, les travailleurs familiaux non rémunérés, les employés absents non rémunérés et les personnes procurant à l'établissement des services à forfait.

La nouvelle formule de l'enquête par sondage sur les petites entreprises

L'enquête sur les petites entreprises a été entièrement automatisée en mai 1968. La première étape de l'automatisation a consisté à enregistrer sur bande magnétique le fichier complet, à jour, des établissements employant moins de 20 personnes. La bande comporte environ 300,000 établissements dont quelque 3,500 emploient de 15 à 19 personnes.

L'échantillon est fondé sur la stratification par territoire et par secteur économique. A partir du fichier d'établissements enregistré sur bande, on a établi 16 strates géographiques (les zones métropolitaines de Montréal, Toronto, Winnipeg et Vancouver, les provinces et les territoires) et 17 strates économiques (certains groupes importants des 8 branches économiques). Ainsi la population se trouve divisée selon 272 strates suivant la situation géographique et le secteur économique. Les établissements faisant partie d'une strate reçoivent au hasard un numéro de lot et l'échantillon est constitué à partir d'un nombre choisi de lots par strate. Certaines strates sont peu importantes, et toutes les unités déclarantes sont alors soumises à la déclaration mensuelle. D'autres strates sont considérées comme trop petites pour que l'on puisse faire un sondage tournant et un nombre fixé de lots restent toujours dans l'échantillon.

La strate "tournante" comporte au moins 16 lots dont 8 font partie de l'échantillon chaque mois. Chaque mois un nouveau lot vient prendre place dans l'échantillon tandis que le lot qui s'y trouvait déjà depuis 8 mois en sort. Ainsi l'échantillon, en tournant, couvre successivement l'ensemble

(3) Parmi les exceptions, figurent les données provenant du relevé de la main-d'œuvre mené dans les ménages et dont la période de référence est fixée au milieu du mois.

(3) Exceptions include data derived from the Labour Force household survey, where the reference period is mid-month.

the population and each unit enters the sample for 8 consecutive months at a time. The 3,500 establishments employing between 15-19 persons are fully covered.

The quality of the data produced has been improved by the use of a more sophisticated imputation technique for non-response, using a change ratio, based on a summation of the reporting units that responded in both the current and preceding month, applied to last month's data. Sample rotation has also allowed for the introduction of a technique for minimizing the bias caused by the accidental inclusion of large establishments in the sample. Large units remain in sample for an additional 7 months, have twice the chance of selection and are given half the weight in the blow-up procedures. The use of a finer industrial stratification in drawing the sample has allowed the publication of additional data; for example, information can now be made available for 7 additional major industry groups(4).

As well as automating the sample selection and rotation procedures, the new system has successfully automated the up-dating of the master file tape, the addressing of questionnaires and the follow-up and response control procedures.

A revision to the estimates was required as a result of a consistant downward bias (between 2 p.c. and 5 p.c.) in the small firm sample for the January 1961 to April 1968 period. The bias was a combined result of non-responses and deferred units in the small firm population and has been removed from the revised estimates shown in this publication. The effect of this bias on the overall estimates was reduced inversely with the proportion of large firms in the industry.

Reliability of the Estimates

The sampling error of the estimates is the difference between the estimates and the value which would have been obtained had a complete census been carried out. While the sampling error is not known, a mathematical calculation of the standard deviation can be made.

Indicators of sampling variability are produced by doubling the standard deviations of the estimates and expressing the values obtained as a percent of the estimates. The sampling error of an estimate will be less than two standard deviations in about 95 cases in one hundred.

The ranges of the alphabetic indicators of sampling variability used in the following table are:

A	0.0 p.c. to 2.0 p.c.
B	2.1 p.c. to 4.0 p.c.
C	4.1 p.c. to 6.0 p.c.
D	6.1 p.c. and over

As an example of the use of these estimates forestry at the Canada level has a B indicator. This would mean that the chances are 95 out of one hundred that the estimate will have less than an 8 p.c. error and 99 out of 100 that any error due to sampling will be less than 10 p.c.

(4) Subdividing construction into building, special trade contractors and other, transportation, communication and other utilities, into transportation and other, and trade into wholesale and retail.

de la population et chaque unité de sondage reste 8 mois de suite dans l'échantillon. Les 3,500 établissements employant de 15 à 19 personnes sont ainsi tous couverts.

On a pu améliorer la qualité des statistiques grâce à une technique plus perfectionnée d'imputation pour tenir compte des non répondants en faisant intervenir un facteur de variation basé sur l'ensemble des résultats des unités déclarantes du mois considéré et du mois précédent et appliquée aux renseignements de mois dernier. On a aussi adopté une technique de rotation destinée à réduire au minimum le biais provenant de l'inclusion accidentelle de grande établissements dans l'échantillon. Les unités importantes restent 7 mois de plus dans l'échantillon. Elles ont deux fois plus de chances d'être choisies et reçoivent un poids moitié moindre au moment de l'extrapolation. L'emploi d'une stratification économique plus fine a permis de publier des renseignements supplémentaires. C'est ainsi, par exemple, que l'on peut maintenant publier les statistiques de 7 groupes économiques supplémentaires(4).

Le nouveau système grâce auquel on a pu automatiser la sélection de l'échantillon et sa rotation a permis avec succès l'automatisation de la mise à jour de la bande magnétique originale de l'envoi des questionnaires et des opérations de suivi et de contrôle des réponses.

La présence d'un biais négatif régulier (de 2 à 5 p. 100) dans le sondage des petits établissements entre le mois de janvier 1961 et le mois d'avril 1968 a appelé une révision des estimations. Le biais provenait de l'influence conjointe de la non-réponse et du délai d'attente des petits établissements; il a été éliminé dans les estimations corrigées qui sont publiées dans le présent bulletin. L'influence de ce biais sur les estimations globales a été réduite en fonction inverse du nombre de grandes entreprises dans le secteur industriel.

Fiabilité des estimations

L'erreur d'échantillonnage des estimations est la différence entre la valeur trouvée de l'estimation et la valeur que l'on aurait obtenue si l'on avait procédé à un recensement exhaustif. L'erreur due à l'échantillonnage n'est pas connue, mais on peut calculer mathématiquement l'écart-type.

On établit des indicateurs de variabilité d'échantillonnage en doublant l'écart-type des estimations et en exprimant les valeurs ainsi obtenues en pourcentage des estimations. L'erreur d'échantillonnage d'une estimation sera égale à moins de deux fois l'écart-type dans environ 95 p. 100 des cas.

Les indicateurs de la variabilité d'échantillonnage employés dans le tableau suivant sont représentés par des lettres suivant leur valeur. On a:

A	0.0% à 2.0%
B	2.1% à 4.0%
C	4.1% à 6.0%
D	6.1% et plus

On peut illustrer l'emploi de ces estimations au moyen d'un exemple: dans le cas de l'exploitation forestière, la variabilité d'échantillonnage à l'échelle nationale est représentée par l'indicateur B. Cela veut dire qu'il y a 95 chances sur 100 pour que l'erreur d'estimation soit inférieure à 8 p. 100 et 99 chances sur 100 pour qu'aucune erreur due à l'échantillonnage ne dépasse 10 p. 100.

(4) En subdivisant la construction en bâtiment, entrepreneurs spécialisés et autres, les transports, communications et autres services d'utilité publique en transport et autres et la commerce en commerce de gros et commerce de détail.

NOTES AND FOOTNOTES

- Notes:
1. Estimates may not add to totals because of rounding.
 2. Data for the Northwest Territories and Yukon are too small to be published separately and are included in the Canada total.
 3. Employees in fishing and trapping are included at the Canada level.

- (1) Employment in hospitals, education and related services, welfare organizations, religious organizations and private households.
- (2) Employment in health services excluding hospitals, motion picture and recreational services, services to business management, personal services except domestic service, and miscellaneous services.
- (3) Excludes non-civilian employees.

NOTA ET RENVOIS

- Nota:
1. Les estimations ne concordent pas toujours avec les totaux à cause de l'arrondissement des nombres.
 2. Les chiffres, trop faibles, des territoires du Nord-Ouest et du Yukon ne peuvent pas être publiés séparément; ils sont compris dans ceux du Canada entier.
 3. Les employés des entreprises de la pêche et le piégeage sont inclus au niveau du Canada.

- (1) L'emploi dans les hôpitaux, l'enseignement et les services connexes, les organismes de bien-être, les collectivités religieuses et les ménages.
- (2) L'emploi dans les services de santé (sauf les hôpitaux), la cinématographie et les services récréatifs, les services extérieurs des entreprises, les services personnels (sauf les services ménagers) et les services divers.
- (3) Ne comprend pas les militaires.
