Overview

Potatoes are the largest vegetable crop in Canada, accounting for 29% of all vegetable receipts¹ and 15% of all horticultural² receipts. In the 2014 calendar year, potato receipts fell 1.1% from 2014 to \$1.04 billion.

Producers reported planting 141,160 hectares of potatoes in 2015, up 1% from 2014. Despite this modest increase in planted area, potato production increased by 5% in 2015 from 2014, due to higher yields. Production reached 4,780,000 tonnes in 2015 – Canada's largest potato production since 2007. The main producing provinces were Prince Edward Island (24%), Manitoba (21%), Alberta (18%), New Brunswick (14%), Quebec (12%) and Ontario (8%). Of the total Canadian production, approximately 66% was destined for the processing sector, 21% to the fresh sector and 13% to the seed sector.

Canada has been a world leader in the production of seed potatoes for more than 90 years and is the fifth largest seed potato exporter in the world. About 150 potato varieties are registered in Canada for the production of seed. The varieties grown in each production area are selected to meet the needs of specific markets and local preferences. Russet Burbank, Shepody, Ranger Russet, CalWhite and Umatilla Russet are the main frying varieties; Superior, Atlantic, Kennebec and Snowden are the main chipping varieties; and Superior, Russet Norkotah, Chieftain, Yukon Gold, Norland, Ranger Russet, Goldrush, Sangre and Umatilla Russet are the leading table varieties.

In the 2014–2015 crop year, exports of Canadian potatoes and potato products were estimated at \$1.36 billion, up 6% from 2013–2014. Canada exported fresh potatoes (table stock and seed potatoes) worth \$202 million and processed potatoes (frozen and other) worth \$1.16 billion during that period. By far, the largest export destination for Canadian potatoes and potato products is the United States. Canada's neighbour to the south takes in 81% of Canadian potato exports, which were worth \$1.1 billion in 2014–2015. Japan (4%) and Mexico (3%) are the second and third largest export destinations, respectively, mostly because of the volume of processed potato products that Canada ships to those two countries.

Canada imported a total value of \$364 million in potatoes in 2014–2015. Of that amount, \$263 million was for frozen and processed potatoes, and the remaining \$101 million was for fresh potatoes (\$98 million for table stock potatoes and \$3 million for seed potatoes).

¹ Vegetable receipts refer to market receipts or farm cash receipts, excluding program payments. They represent the income received from the sale of agricultural commodities.

² The horticulture sector consists of greenhouse vegetables, other vegetables, potatoes, tree fruits, small fruits, floriculture, nursery, sod, Christmas trees, maple products, honey and ginseng.

Seasonal Review 2014 – 2015³

Prince Edward Island (PEI)

In PEI, growers enjoyed generally favourable weather during the 2014 planting season. Although the spring was late and some areas had extended dry periods in the summer, in most cases the crop finished well with excellent weather from August to October. The resulting crop was variable, ranging from individual growers having strong yields and good quality in some areas to significant quality issues in others.

Statistics Canada estimated PEI's planted acreage in 2014 at 90,500 acres, up 1.7% from 2013. The first load of new-crop potatoes left the province on August 18, 2014. Favourable weather conditions during the harvest period meant that only 300 acres of potatoes went unharvested, giving a 1.3% increase in harvested acres compared with the 2013 crop. Total production rose to 25.2 million cwt⁴ in 2014, up from 25 million cwt in 2013 (a 0.9% increase). Statistics Canada estimated yields at 279.8 cwt/acre.

In 2014–2015, prices for table stock potatoes decreased from 2013–2014, falling to similar levels as seen in 2012–2013. Movement of PEI potatoes to Canadian and US markets was similar to 2013–2014. Movement to export markets was below average. Overall, fresh movement was down 5% compared with 2013–2014.

The average price for 10-lb paper bags during the 2014–2015 season was \$1.47, down from the average price of \$1.87 in 2013–2014.

New Brunswick (NB)

The 2014 NB fall harvest was held in almost-perfect weather conditions, as the weather was ideal for digging in late September and early October. The main harvest period began the week of September 22, 2014. The province saw some frost that same week, which shut down some plants a little earlier than expected and reduced yields from affected fields. Harvest was completed by the third week of October, and there have been no reports of any storage issues. The potatoes were kept in excellent conditions, with the latest deliveries made just before or during the 2015 harvest.

The 2014 NB potato crop was similar to the 2013 crop in terms of quality. Overall provincial yield averaged from slightly below average to very good, and quality was very good in all regions. Many growers in the more northern regions saw close to record yields along with very good quality. Growers in the southern growing areas experienced a very dry period in August and September and saw lower yields, but the crop quality is excellent. Potatoes that have gone to the province's processing plants are showing very good quality attributes and payables.

The 2015 planting season started in mid-May and was completed by the second week of June, which is the usual range. By the end of the planting period, the earlier planted fields were starting to emerge. Rainfall for the month of May was slightly above normal for growers in southern areas, and it was slightly below normal for growers in more northern regions. The number of acres planted in 2015 decreased slightly versus 2014, that is approximately 500 acres less than in 2014. The average price for processing

³ Most of the data are based on crop years that run from August of one year to July of the following year and are expressed as such (e.g. 2014–2015). Data based on calendar years are expressed as a single year (e.g. 2015). Seasonal reviews were prepared by provincial organizations; see Key Resources. Seasonal reviews for Newfoundland and Labrador and for Nova Scotia are not available.

⁴ cwt: Hundredweight (short, US).

potatoes is approximately \$10.55/cwt, an average of \$10 to \$10.50 for fresh (table) potatoes. Seed prices are difficult to confirm, but \$15 to \$17/cwt would be a reasonable average.

Quebec (QC)

In 2014, QC obtained an average yield of 277 cwt/acre, which was higher than the previous year. The quality was good, and there were no warehouse storage problems. Note that from a phytosanitary point of view, the seed potatoes had a very low virus rate.

The total potato acreage in QC has been relatively stable for a number of years. The same observation may be made about the market destination. Potatoes for the fresh market continue to account for approximately half (52%) of the production. The rest of the production is for pre-peeling (21%), chipping (16%) and planting (11%).

Prices remained stable for potatoes produced for the french fry market, while those produced for the chip market dropped slightly. As for the fresh market, prices were down compared with those of the previous year.

After a difficult winter, planting began a little late in 2015, especially in heavier soil and in the eastern regions of Quebec. However, the delays were quickly made up and the season ended with excellent yields.

Ontario (ON)

In fall 2014, ON potato growers produced 373,080 tonnes of potatoes from 14,164 harvested hectares. The value of the crop was just over \$100 million. Approximately half of the crop was used for potato chips, and the rest was used for table consumption.

The 2014 growing season presented many challenges. The season was cool and wet with little sunshine. Potatoes thrive in cool and wet conditions but not to the extremes we saw in 2014. Many low areas were flooded out or suffered water damage. In addition, late blight became a problem in some areas, especially for certain varieties. In spite of all the wet weather issues, most growers were able to harvest above average yields of good quality potatoes. Approximately 500 acres were left in the fields. Most harvested potatoes stored well throughout the winter. The presence of blight, along with the wet growing conditions, caused some storage issues as well as problems with process quality.

The 2015 growing season began earlier than usual. In some areas, planting began in the last week of March, with the rest of the province following by late April. Heavy frost in some areas set back some early crop potatoes by one or two weeks. As a result of favourable growing conditions, potato harvesting was in full swing by the second week of July.

Manitoba (MB)

2015 potato acreage in MB increased to 67,327 acres in 2015 from 63,350 the previous year. Favourable spring conditions contributed to early planting, with replanting limited to the Portage La Prairie region following heavy spring rains. The early start raised growers' yield expectations and helped to curb overplanting.

Some pricing gains were achieved, partially offsetting the substantial decrease the previous year. The potato industry in Manitoba remains a significant economic driver, contributing over \$1 billion to the provincial economy.

Marketing of the 2014 crop faced some early challenges due to wet harvesting conditions. Some storage losses were experienced and overall quality was slightly down. Strong yields ensured adequate supply.

Saskatchewan (SK)

Potato acreage in SK dropped slightly in 2014 to about 6,500 acres, mainly due to the cold wet spring. Although there were concerns about harvest quality due to abundant moisture, crop quality was good.

Tablestock prices were slightly lower than the previous year, at \$13 to \$15 per cwt packout for table Reds and \$11 to \$12 for Russets; however, but the entire crop sold. Post-harvest test readings on seed potato crops were excellent, with almost no viruses found. Seed prices were good and almost all seed sold.

Spring 2015 was one of the driest on record. The crop was planted relatively early, although producers with irrigation were kept busy throughout May and June. In July, however, it began to rain heavily.

Alberta (AB)

The industry continues to contribute over \$1 billion of economic value to the AB economy. AB's 21,000 hectares produced over 849,500 tonnes in 2014. While acreage of fresh and seed potatoes increased in 2014, acreage of processing potatoes has remained relatively stable over the last five years. The overseas Asian market continues to grow every year, which is promising for the AB industry.

In 2015, growing conditions were very sporadic throughout the entire province. Some rather heavy downpours and cool weather during planting did not give the crop a good start in the south. Late August rains and an early September frost caused some issues both at harvest and during the storage season. The shortened fall had a huge impact on the gravity and size of the Russet crop in the south. Overall, the storage crop was one of the poorest in years as far as quality was concerned.

Seed and fresh quality was very good, as growing conditions (lots of sunshine and timely rains) in those areas were conducive to a good crop. Growers continued to try to match production requirements so as not to cause overproduction pressures on the markets.

British Columbia (BC)

There were no disease or storage issues of significance for the 2014 harvest. The devaluation of the Canadian dollar by 14 cents over the year had a significant impact on helping to counter low potato pricing being quoted from the United States (US). However, pricing on BC product was down 1% for the total category, while the total sales volume increased by 5%. Greater availability of Reds and Yellows in the BC market put pressure on fresh market pricing of these potato types. The market for Russets remained relatively stable, with increased sales. Demand for Whites helped firm up pricing, and there was an increase in volume. A significant factor that affected the potato sector this year was the commencement of the 2015 CITT⁵ expiry review on the dumping and subsidizing of certain whole potatoes imported from the US for consumption in BC.

⁵ CITT: Canadian International Trade Tribunal.

Spring weather for the 2015 planting season was uncharacteristically dry and at historically low precipitation levels. There were no issues with getting crops in the ground. Planted acreage was up 11% from 2014, representing a 10% increase compared with the three-year average. The growing season was long, sunny and warm. Growers relied on irrigation to bring the crops to size. Harvesting came on strong early in the season, with volume available to market about three weeks earlier than usual. In spite of some quality issues, the majority of growers enjoyed good product quality. No acreage went unharvested, and good weather continued into the fall. Most of the crop was placed into storage by early October, with November 1 storage inventory up 8% compared with the prior year. Yields were good, but with strong early season sales potato inventories were slightly lower than anticipated with the increase in acreage.

1. Number of farms and production

1.1. Number of potato farms in Canada (2006 and 2011)

	2006	2011	% change 2011/06
Newfoundland and Labrador	26	25	-4%
Prince Edward Island	330	262	-21%
Nova Scotia	17	13	-24%
New Brunswick	238	193	-19%
Quebec	274	224	-18%
Ontario	243	170	-30%
Manitoba	153	99	-35%
Saskatchewan	91	61	-33%
Alberta	162	149	-8%
British Columbia	73	127	74%
Canada	1,607	1,323	-18%

Note:

Number of farms includes all farms reported to be growing potatoes and on which potato production represents 50% or more of total farm cash receipts.

	High	\$24.10	\$18.30	\$22.75	\$25.25

Notes:

Ctn: Carton.

Prices are based on Canada No. 1 grade potatoes.

Wholesale asking prices shown as not available are due to a lack or limited number of collaborating wholesalers quoting prices for the time period and market in question.

Weekly wholesale to retail market prices refer to markets where prices are reported once a week.

This data is not comparable across markets as varieties, package sizes (unity quantity) and origin may differ.
