### ABSTRACT

This report contains the profile data collected by Bayfield Laboratory, Ocean Science and Surveys, in the centre section of the Northwest Passage during the month of April, 1983. The conductivity and temperature data were obtained with a Guildline Mark IV CTD probe deployed from the ice surface using a small portable Arctic profiling winch. A helicopter (Bell 206B Jet Ranger), based at the Polar Continental Shelf Project camp at Resolute Bay, N.W.T., was used as the means of transportation and contained the recording electronics of the CTD system. The time-series current meter and time-series CTD data collected during this survey will be published separately in Volume II.

### ACKNOWLEDGEMENTS

The authors would like to thank the members of the Polar Continental Shelf Project and their personnel stationed at Resolute Bay. Their assistance with the logistics in aircraft procurement and coordination as well as aid in handling of maintenance and equipment is most appreciated.

Mr. D. Moore is thanked for collection of the data, Mr. D. Robertson for the maintenance of the CTD system and Mr. D. Brooks for handling the overall logistics of the survey as Officer-in-Charge.

The authors are indebted to Dr. E.B. Bennett for his participation and planning of the project and to Mrs. J. Fiddes and the cartographic staff for the editorial and drafting work, respectively.

## 1. INTRODUCTION

The CTD data represented in this report were collected as part of an Arctic oceanographic program to fill an information gap needed for the safe development and wise management of the Canadian Arctic. Year-round shipping through this part of the Northwest Passage is likely to occur in the near future, thus a program to study the year-round oceanographic properties of this area was needed.

In March 1981, the Bayfield Laboratory initiated the multi-year Barrow Strait project to address the recognized need for long-term monitoring of ocean conditions in a section of the Northwest Passage. This project became a multi-laboratory project under the aegis of the Subcommittee on Arctic Oceanography (SCOA) of the Canadian Committee on Oceanography.

The 1983 survey not only collected CTD data but also current and water level height time-series, nutrient and phytoplankton samples and current meter profile data (further detail in Field Report by D.J. Brooks, 1983). The survey area is over, and east of, the Barrow sill, just south of the PCSP base camp at Resolute Bay (see Figure 1). The survey was conducted during March and April. The CTD data is presented in this report while the time-series and current meter profile data will be published in a second volume. The 1983 survey was the fourth CTD survey of the area; the others were in 1979, 1981 and 1982 whose data has already been published in the same data format as this report.

## **2. DATA COLLECTION**

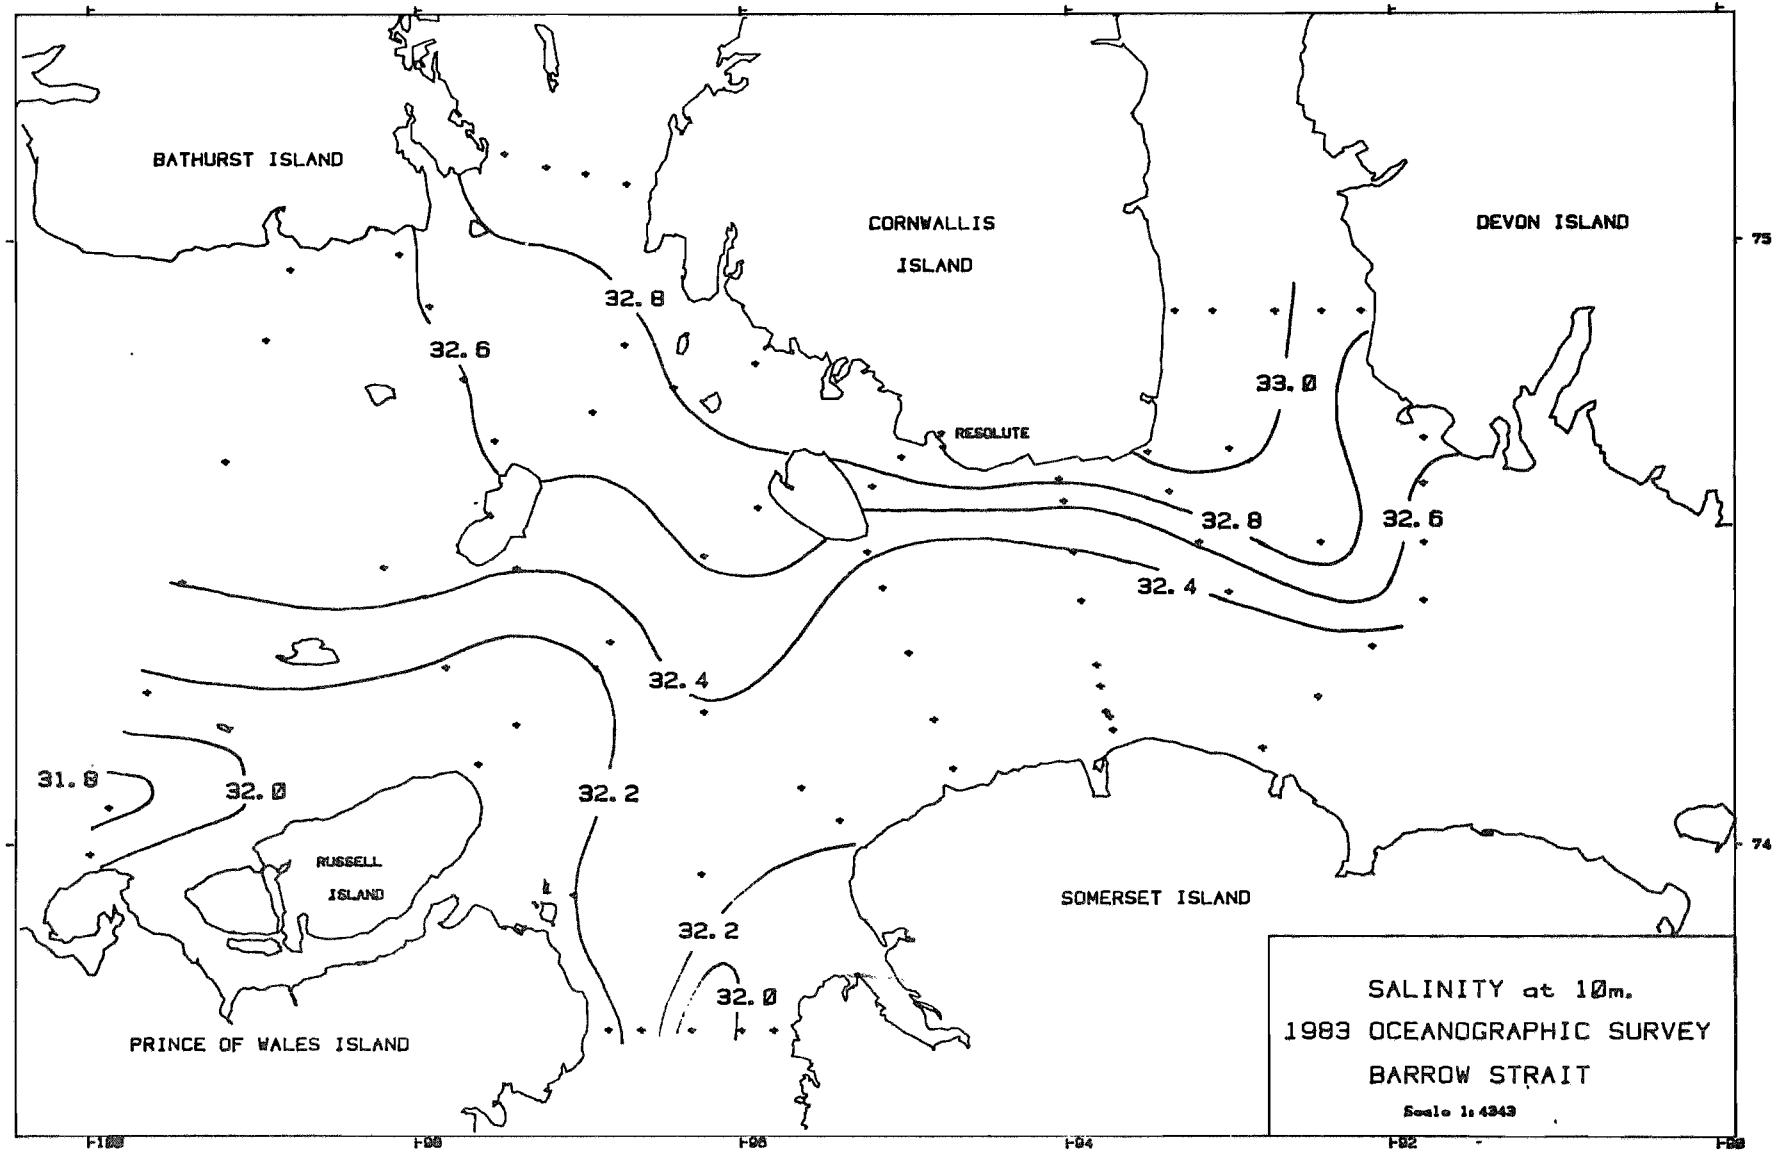

### **2.1 Positioning**

A Bell 206B Jet Ranger helicopter equipped with a Mini-Ranger navigation system was used during the CTD portion of the survey. The Ranger coordinates of the CTD stations were recorded on station logs to be converted to latitude coordinates by a HP9825 programmable calculator at base camp in Resolute. Figure 2 shows the location of the CTD stations, the numbers refer to the last two digits of the station number as listed in the "CTD Station Listing."

### **2.2 CTD System**

The CTD system consisted of a Guildline Mark IV CTD probe, Guildline deck unit, and a TEAC PC-10 cassette tape recorder. The probe was lowered and raised through the water column by a lightweight portable Arctic winch designed by Bayfield Laboratory, Ocean Science and Surveys. The Guildline Mark IV probe senses pressure, temperature and conductivity ratio in analogue form, then digitizes and transmits the data up a single-conductor cable as two twelve-bit words. The sampling rate is 40 milliseconds per channel, about eight sets per second, and is recorded on the audio cassette recorder. It is checked by displaying the data on the deck unit.

The Guildline Mark IV measures salinity, temperature and depth values accurate to  $\pm 0.01\%$ ,  $\pm 0.01^\circ\text{C}$  and  $\pm 1\%$  full scale, respectively. Static calibration tests prior to and after the project fell well within these ranges. Comparison profiles were done with pairs of probes used by Bayfield Laboratory and Arctic Sciences Ltd. (Sidney, B.C.) at Station #75 and by I.O.S. (Sidney, B.C.) at Station #46.

Comparisons of values in the surface and bottom stable layers showed that all three probes read within 0.015°/oo and 0.010°C.

### **3. DATA PROCESSING**

The CTD profile data were processed in the field through a data reduction system consisting of a HP programmable calculator, printer and plotter. Programs to filter and select sets of temperature and conductivity data at up to 50 specified depths were used. A backup Guildline deck unit and TEAC cassette tape recorder were used to transfer the recorded data from cassette tapes to the calculator. The HP was used to produce printouts and graphs for editing of the data prior to the selected CTD data being stored with station header information on HP cassette tapes. The final copies of the data listings are shown in the data listing section of this report as are the plots.

### **4. PRELIMINARY CTD RESULTS**

The edited CTD data were used in the field to draw salinity and temperature cross-sections and topographical maps in order to check on the quality of all the data before completion of the survey. One of these drawings (Figure 3) is shown here. It is a salinity contour diagram (at 10 m depth) and shows that less saline surface water from Viscount Melville Sound (west of the area) and from Pell Sound (south of the area) enters the area, and mixes and moves eastward along the southern part of Barrow Strait. High saline surface water (due to strong vertical mixing) is seen at the entrances of the two northern channels on either side of Cornwallis Island. The high saline water west of Cornwallis Island appears to join the general

eastward flow and mixes and actually moves below the less saline surface water. The high saline water east of Bathurst Is. moves down along its east coast and also joins the general eastwards flow. These results are very similar to those found in the spring of 1978 (Prinsenberg, 1978) and in 1981 and 1982 (Prinsenberg and Sosnoski, 1983) for the same area. The main difference between the four surveys was that the extreme cold winter of 1983 resulted in an ice-cover which was on the average one metre thicker than in the other years. This caused a deeper surface mixed layer as well as higher surface layer salinity values. The basic circulation patterns remained the same.

### CTD STATION LISTING

The header information for each set of CTD data profiles is stored on the Hewlett-Packard data tapes and is recalled by a program (LISTING) which combines it with header information of the other stations to produce a station listing as shown in Table 1. It lists all the header information stored for each set of CTD profiles. The time of data acquisition is shown in Julian days and Greenwich Mean Time (hours and minutes) and the location in degrees and minutes of north latitude and west longitude. For each set of CTD profile data, three depths in metres are listed. They are the bottom depths (Bottom), ice thickness (Ice), and deepest depth obtained (STD).
