## **Canadian Data Report Of Hydrography and Ocean Sciences**

These reports provide a medium for the documentation and dissemination of data in a form directly useable by the scientific and engineering communities.

Generally, the reports will contain raw and/or analyzed data but will not contain interpretations of the data. Such compilations will commonly have been prepared in support of work related to the programs and interests of the Ocean Science and Surveys (OSS) sector of the Department of Fisheries and Oceans.

Data Reports are produced regionally but are numbered and indexed nationally. Requests for individual reports will be fulfilled by the issuing establishment listed on the front cover and title page. Out of stock reports will be supplied for a fee by commercial agents.

Regional and headquarters establishments of Ocean Science and Surveys ceased publication of their various report series as of December 1981. A complete listing of these publications and the last number issued under each title are published in the *Canadian Journal of Fisheries and Aquatic Sciences*, Volume 38: Index to Publications 1981. The current series began with Report Number 1 in January 1982.

## **Rapport statistique canadien sur l'hydrographie et les sciences océaniques**

Ces rapports servent de véhicule pour la compilation et la diffusion des données sous une forme directement utilisable par les scientifiques et les techniciens.

En général, les rapports contiennent des données brutes ou analysées mais ne fournissent pas d'interprétations des données. Ces compilations sont préparées le plus souvent à l'appui de travaux reliés aux programmes et intérêts du service des Sciences et Levés océaniques (SLO) du ministère des Pêches et des Océans.

Les rapports statistiques sont produits à l'échelon régional mais sont numérotés et placés dans l'index à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page de titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

Les établissements des Sciences et Levés océaniques dans les régions et à l'administration centrale ont cessé de publier leurs diverses séries de rapports depuis décembre 1981. Vous trouverez dans l'index des publications du volume 38 du *Journal canadien des sciences halieutiques et aquatiques*, la liste de ces publications ainsi que le dernier numéro paru dans chaque catégorie. La nouvelle série a commencé avec la publication du Rapport n° 1 en janvier 1982.

## ABSTRACT

Tabata, S. and R.M. Brown. 1994. Hydrographic/CTD observations made during Ocean Climate Monitoring Study: 1981-1991 - A summary of operational phase of Study. Can. Data Rep. Hydrogr. Ocean Sci. 136: 42 pp.

Forty-six cruises conducted during June 1981 through November 1991 to make oceanographic observations along Line P, Station P and other associated lines are featured. Description of cruises includes dates of observations, ships, personnel and institutions participating on cruises, types and amount of data obtained.

Key words: Hydrographic/CTD data; Northeast Pacific Ocean; Ocean Climate data.

## RÉSUMÉ

Tabata, S. and R.M. Brown. 1994. Hydrographic/CTD observations made during Ocean Climate Monitoring Study: 1981-1991 - A summary of operational phase of Study. Can. Data Rep. Hydrogr. Ocean Sci. 136: 42 pp.

Quarante-six croisières complétées en juin 1981 jusqu'à novembre 1991 pour effectuer des observations océanographiques le long de la ligne P, à la station P et le long d'autres lignes associées sont présentées.

La description des croisières comprend les dates d'observations, les navires, le personnel et les établissements participant aux croisières, les sortes et les quantités des données recueillies.

Mots-clé: Données hydrographiques/CTD; nord-est du Pacifique; données Climat Oceanique.

## HYDROGRAPHIC/CTD OBSERVATIONS MADE DURING OCEAN CLIMATE MONITORING STUDY: 1981-1991 - A SUMMARY OF OPERATIONAL PHASE OF STUDY

S. Tabata and R.M. Brown

### INTRODUCTION

In June 1981 the two weatherships that had occupied Ocean Station P ("PAPA") at Latitude, 50° 00' North; Longitude, 145° 00' West; in the northeast Pacific Ocean (Fig. 1) were withdrawn from service. This brought to an end among others, the regular time-series oceanographic observations that had continued there since 1956 and along Line P (between Station P and Victoria, British Columbia along the southern Pacific coast of Canada) since 1959.

However, in view of the importance of long ocean time series measurements, especially for the study of ocean climate, the oceanographic observations at Station P and Line P were continued under a project named "Ocean Climate Monitoring Study" (OCMS). Although the sampling frequency was much less than in the past, the completeness and the density of observations along Line P were superior to any that were made in the past two decades.

The Ocean Physics (OP) and the Ocean Climate Chemistry (OCC) Divisions of the Institute of Ocean Sciences (IOS) of the Department of Fisheries and Oceans of Canada (DFO) was the major contributor to the project. Others such as the Pacific Biological Station (PBS) of DFO also contributed to the observations. IOS's own research vessels, the Canadian Survey Ship (CSS) Parizeau (later shown in Fig. 3) and CSS John P. Tully (Fig. 4), made most of the observations. Canadian Naval Auxiliary Vessel (CNAV) Endeavour (Fig. 5) of the Defence Research Establishment Pacific of the Department of Defence of Canada and CSS W. E. Ricker (Fig. 6) of PBS also contributed to the observations. Initially it was possible to make six cruises per year but later, ship schedules permitted only two to four cruises per year.

Since October 1991 the series of observations at Station P and Lines P and R (Fig. 1) have been enhanced and are designated as one of the "Repeated Hydrographic Sections" of the World Ocean Circulation Experiment (WOCE). Observations there are expected to continue to at least the end of this Experiment (10 years).

The present report comprises a summary of the operational phase of the study, the cruise data, ships and personnel participating in the cruises (Table 1), location and depths of stations (Table 2), schedule of hydrographic (hydro) and (Conductivity-Temperature-Depth (CTD) observations (Table 3), and a summary of cruise descriptions (Table 4). The above observed physical data were processed by the OP Division of IOS. Other observations such as sampling for nutrients and geochemical properties were processed by the OCC Division, and interested readers should contact them regarding their data. A short summary of nutrient observations is however appended (Appendix 1).

Manuscript reports pertaining to Station P and Line P oceanographic data that have been published within the past decade include:

Statistics of oceanographic data based on hydrographic/STD casts made at Ocean Station P during August 1956 through June 1981 (Tabata and Peart, 1985a),

Statistics of oceanographic data based on hydrographic/STD casts made at Stations 1 through 6 along Line P during January 1959 through June 1981 (Tabata and Peart, 1985b),

Statistics of oceanographic data based on hydrographic/STD casts made at Stations 7 through 12 along Line P during January 1959 through June 1981 (Tabata and Peart, 1986).

An update of the above statistics based on inclusion of data taken by the University of Washington in May and June 1956 and those taken by research vessels after June 1981 through September 1990 has been made. The associated reports are:

An update of the statistics of hydrographic/CTD data taken at Ocean Station P, May 1956-September 1990 (Tabata and Weichselbaumer, 1992a),

An update of the statistics of oceanographic data based on hydrographic/CTD casts made at Stations 1 through 6 along Line P during January 1959 through September 1990 (Tabata and Weichselbaumer, 1992b),

An update of the statistics of oceanographic data based on hydrographic/CTD casts made at Stations 7 through 12 along Line P during January 1959 through September 1990 (Tabata and Weichselbaumer, 1992c).

In addition to the above, one manuscript that includes the "Ocean Storms" Project has been published:

STP/hydrographic observations along Line P, Station P, Line R and associated lines and in the "Ocean Storms" area: Cruise I - 22 September-16 October, 1987, Cruise III - 24 November-9 December, 1987 (Tabata et al., 1988).

The main purpose of this report is to present sufficient material that may be of some assistance to those planning to use the above data sets.

#### STRATEGY OF OBSERVATIONS

Originally it was planned to make observations along Line P during both the outbound and inbound journeys. For reason of economy this was to be accomplished within the allotted "2-week" shiptime with one week-end at sea. It was apparent that more important overall information would be gained by taking another route during the inbound

passage, either along a line to the south or north of Line P. Alternately, a zig-zag route, including stations along Line P and lines about 100 km north and south parallel to Line P would have yielded reasonably good spatial coverage in the vicinity of the Line, but this required more travelling time than was permissible. The northern route which is approximately parallel to Line P, named Line R (Fig. 1), was considered for the following reasons. First, previous observations in the general vicinity indicated recurring eddy-like features there. Therefore it appeared worthwhile to see if their occurrences could be substantiated as they might affect our interpretation of the dynamics of ocean circulation off the Pacific coast of Canada. Secondly, this line intercepts the migratory route of the returning adult sockeye salmon to the Fraser River (Fig. 2) so data from there would be of potential use for forecasting their return runs. Thirdly, this route is much shorter (by 1/3) than Line P\*.

\*The distance between Station P and Swiftsure Bank ( $48^{\circ} 32.6'N$ ,  $125^{\circ} 00.0'W$ ) at the approaches to Juan de Fuca Strait (Fig. 2) is 1459 kilometres (km) or 788 nautical miles whereas that between Station P and Station J01, about 16 km northwest of Cape St. James ( $52^{\circ} 00.0'N$ ,  $131^{\circ} 10.3'W$ ), is 987 km. The closest shore from Station P is Hippa Island, located two thirds up the Pacific coast of Queen Charlotte Islands ( $53^{\circ} 32.6'N$ ,  $133^{\circ} 00.7'W$ ) and about 20 km northwest of the approaches to Rennell Sound (Fig. 2). The associated distance is 913 km and is therefore 74 km shorter than is Station P - J01 line. However, since the distance between Hippa Island and Station J01 is 211 km the overall distance via Hippa Island during the return journey would be 137 km longer than is one between Station P and Station J01 direct. Actually, Line R is not a line extending directly from Station P to Cape St. James but originates at Station P, passes through Station P32 lying 100 km to north of Station P, to Station J05 located 100 km southwest of Cape St. James. This line is 35 km longer than the direct P - J01 line but is still shorter than Station P - Hippa Island - Station J01 route. Therefore it is more economical to travel along Lines R and J rather than through Hippa Island during the return journey.

Since the distance between Station J01 and Swiftsure Bank is 585 km the return journey via Lines R and J (1022 km) to Swiftsure Bank is 1608 km and is therefore 148 km longer than Line P. Given a ship's service speed of 11 knots this would add only about 7 hours to the travelling time on the return journey compared to what it would take to return along Line P. With the observations planned along Line P, Station P, Lines R and J as well as those between Station J01 and Swiftsure (Fig. 1) there is still some time remaining during the "2-week" cruise to make further observations. Two lines perpendicular to the Pacific coast of Vancouver Island off Estevan Point (Line B) and Tofino (Line A) are added. These lines are arranged to intercept Line P (Fig. 1). One of the stations along Line B will be P06 and the other along Line A will be P04, both designated stations of Line P. The addition of these two lines and returning along Line P via Station P04 contributes additional 428 km to the return journey, and thus would add 21 hours to the travelling time. The total mileage from IOS via Lines P, R, J, B and A becomes 3969 km which would require a little over 8 days of travelling time. A total of nine hydrographic casts, including two at Station P to bottom, would take approximately one day and 89 CTD casts including two at Station P, mostly to 1500 m depth, would take 2 1/2 days. The combined hydrographic and CTD casts would take 3 1/2 days, thus requiring 11 1/2 days for travelling and observations. Given a "2-week" cruise it is possible to make all the observations in the allotted shiptime (from midnight of Sunday to Friday afternoon). This is a tight schedule indeed, but all observations could be made under ideal operational condition including favourable weather. Only during 7 cruises (16%) was it possible to occupy all the designated Lines P, R and J and at least 50% of coverage on each of Lines A and B (Table 4).

## SHIPS AND PERSONNEL

A total of 46 cruises made observations at least along some part of the designated lines, especially those near the coast. However, only 39 made observations at least along Line P or Station P. The remaining 7 were associated with other projects {e.g. North Coastal Ocean Dynamics Experiment (NCODE), La Perouse Project (LP), etc.} and were unable to occupy the lines adequately. Approximately two thirds of the total of 46 cruises were made by CSS Parizeau (Fig. 3) and one quarter, by CNAV Endeavour (Fig. 5) (Table 1). The remainder were made by CSS John P. Tully (Fig. 4) and CSS W.E. Ricker (Fig. 6). During the 39 dedicated cruises about one quarter of the time the ships were commanded by A. Chamberlain, followed by P. Frost and W. McMunagle (Table 1). The remainder were by B. Newton, J. Anderson, J. Campbell, S. Bowles, A.J. Ranger and S. Gulati.

The great majority of the scientific and technical personnel participating in cruises were of course from IOS. As is evident from Table 1, 33 members from IOS went to sea. Of these three (Minkley, Bellegay and Soutar) were involved in more than half of the total number of cruises. Five were however temporary observers serving under the federal program, Fisheries Research Employment Development (FRED). In addition to the above, observers from other Canadian institutions participated. They were: PBS, Marine Environmental Data Service (MEDS) and Communication Branch of DFO; Canadian Wildlife Service (CWS) and Atmospheric Environment Service (AES) of the Department of the Environment, Government of British Columbia (BCG); University of British Columbia (UBC), University of Victoria (UV) and University of Quebec. There were also participants from outside Canada, mainly from the U. S. A. (Woods Hole Oceanographic Institution (WHOI), Scripps Institution of Oceanography (SIO), National Center for Atmospheric Research (NCAR), University of Washington (UW), Oregon State University (OSU), University of Carolina (UC), University of Miami and National Marine Fisheries Service of National Oceanic and Atmospheric Administration (NOAA)). There were others from Centro de Investigacion Cientifica Y Educacion Superior de Ensenada (CICESE) of Mexico, Third Institute of Oceanography (TIO) of China and Pacific Oceanological Institute (POI) of Russia. A total of 15 observers also participated under contract to IOS. Of this, two originally participated as FRED observers. One (Yelland) made cruises under FRED, under contract and finally as a member of IOS.

## DESIGNATED STATIONS

Prior to August 1981, there were 12 stations along Line P excluding Station P, designated 1 through 12. In August 1981, this line of stations was expanded to 24 stations along the line (P01-P24) and additional ones in the vicinity of Station P (now called P26). They were: P25, P35, P26E, P41, P32, P34, P49, P33. The letter, P, was prefixed to Line P stations in order to avoid confusion with stations along other lines.

The location and depths of major designated stations are shown in Table 2 (see Fig. 1 for approximate position of stations). There are more than twice the number of stations

(28 including Station P) along Line P than previously, with the heaviest concentration of stations along the eastern half of the Line. The spacing between stations along this side is less than 37 km whereas along the western half it is twice this distance.

The combination of Lines R and J consists of over 20 stations. Stations are usually spaced about 50 km offshore and less near the shore. Line J, off Cape St. James is oriented perpendicular to the west coast of the Queen Charlotte Islands (Fig. 2).

Lines A and B are both oriented perpendicular to the west coast of Vancouver Island (Fig. 2). Line B (Estevan Line) begins off Estevan Point. It is included to supplement the many lines taken in its vicinity in the past (before 1972) so the more recent sets of data can be compared with those taken in the past. The purpose of Line A, off Tofino, is to relate the oceanographic condition along the Line with the hourly sea level measurements made at Tofino and Bamfield so that eventually it may be possible to depict some aspects of the oceanographic condition over the continental shelf/slope off Tofino from the interpretation of sea level records taken at Tofino or Bamfield. The stations of both Lines A and B are spaced at less than 7 km. Both lines intersects Line P, Line A at Station P04 and Line B at Station P06.

#### **HYDROGRAPHIC AND CTD OBSERVATIONS**

All the stations occupied during the 39 major cruises and those (7) taken under other projects are listed in Table 3. Their associated data include Consecutive Number on the archival file, station name, time and date of hydrographic and CTD stations, maximum nominal depths of the casts and helpful remarks related to casts.

#### **SUMMARY OF CRUISE DESCRIPTION**

Table 4 indicates that Station P was occupied 37 times during the 39 dedicated cruises. However, Line P was not occupied to the above extent. It was completely sampled about three quarters of the time (29), and part (more than 5 stations) of it was observed another nine times. It is to be noted that during the two decades before 1981, Line P was occupied completely only once in November 1961. However, from 1981 to 1991, it has been sampled four times (1982, 1984, 1985 and 1987). Lines R and J were sampled 20 and 19 times, respectively while Lines A and B were sampled 13 and 14 times, respectively. Line Z which was added recently (May 1990) was observed only three times.

Seasonally the best coverage of Lines P and R was in 1982 when they were occupied six times.

Both Lines A and B were discontinued after May 1991 but the former, in a little modified form, has been continued, as Line E under the La Perouse Project.

## OBSERVED DATA

The CTD temperature and salinity profiles were observed with Guildline analogue and digital probes. Hydrographic casts were made by the use of Niskin sampling bottles, each fitted with two protected reversing thermometers. For samples at depths greater than 200m a single unprotected reversing thermometer was also attached to each bottle. Salinities (in duplicate) were determined with Guildline laboratory salinometer at IOS. The dissolved oxygen content was determined aboard the ship using a modified Winkler method (Carpenter, 1965).

An independent seawaterloop system designed to provide continuous flow of water for oceanographic sampling is available on the ships. The intake is located at about three to four metres below the surface (water line). Initially the temperature and salinity readings were recorded continuously using Plessey Thermosalinograph. Subsequent measurements of temperature, salinity, ship's position and speed, and wind velocity were made digitally at 2-minute intervals using the IOS designed SAIL (Serial ASCII Instrumentation Loop) system.

For calibrating CTD values, we used comparable data from hydrographic casts, and special calibration samples (sampling bottles placed a few metres above the CTD sensor, usually at 1500 decibars). In the case of salinity in the upper mixed layer, the "three-metre" samples from the ship's seawater loop system were used.

## PROCESSED DATA

All conductivity data have been converted to salinity using the formula derived by Perkin and Lewis (1980) which has been recommended for general use (Fofonoff and Millard, 1983).

For hydrographic data, the thermometric depth was obtained by the usual "depth difference" method (e.g. Collins et al., 1969). Missing hydrographic data were obtained using a weighted parabolic interpretation method (Reiniger and Ross, 1968).

Readers interested in details of procedures and algorithms used to obtain observed and processed data may find them in one of the representative data reports such as for the "Ocean Storm" cruises of 1987 (Tabata et al., 1988).

Amongst the data archived at the Ocean Physics Division of IOS are:

1. The original CTD data containing temperature and salinity at one-metre averages;
2. The hydrographic data at nominal standard depths;
3. SAIL data which comprise "sea-surface" temperature and salinity, ship's position and speed, (and occasionally meteorological data including wind velocity) at 2-minute intervals;
4. Digitized surface temperature and salinity data recorded "continuously" by the thermosalinograph;
5. Additional data such as surface bucket and loop samples for temperature and salinity.

#### ACKNOWLEDGEMENT

We would like to thank Dr. R.E. Thompson for making many oceanographic observations along the designated lines of OCMS during the North Coastal Ocean Dynamics Experiment and La Perouse Project and also for permitting us to include in this report the data taken during his cruises.

We gratefully acknowledge the following for assistance in compiling this report:

A.Y.P. Lee and C. de Jong for assisting in the preparation of Table 3  
P.M. Kimber for making the illustrations  
N. Delacretaz for preparing the manuscript  
F. Whitney for supplying the nutrients data (Appendix 1)  
and  
D.J. Stucchi for reviewing the manuscript.

Z05	53 09.0	145 00.0	4140	
Z06	53 36.0	145 00.0	3940	
Z07	54 03.0	145 00.0	4020	
Z08	54 30.0	145 00.0	4020	
Z09	55 00.0	145 00.0	4100	

The E and G Lines of La Perouse Project corresponds approximately to the A and B Lines, respectively. Their Line G is approximately 10 km southeast of Line B while their Line E is about 1 km southeast of Line A. Their Station E08, in particular, coincides with Station P04 of Line P.

Table 3. Schedule of hydrographic and CTD observations for each cruise (identified by respective Cruise Identification Number). Dedicated OCMS cruises are prefixed by letters, MS.

From 1987 the cruise identification number was changed (hyphen placed between the year and consecutive cruise number was deleted).

(Abbreviations: CONSEC NO = Consecutive Number, UTC = Universal Time Coordinate, db = decibar; others are indicated in the text):

Table 4. Summary of cruise descriptions including cruise identification numbers, dates, observing ships, coverage of lines of observations and pertinent remarks regarding observations. Cruise ID's with MS represent dedicated cruises. Dates of cruises denote the beginning and end of cruises and not necessarily those associated with observations. In the columns under Lines, crosses represent at least 80% occupation of number of designated stations in the line; numerals represent numbers of stations taken when the above condition was not met. During some cruises additional stations were taken. (Abbreviations or notations: No = Number, yy = year, mm = month, dy = day, Stn = Station. Ships: P = Parizeau, E = Endeavour, T = John P. Tully and R = W.E. Ricker).

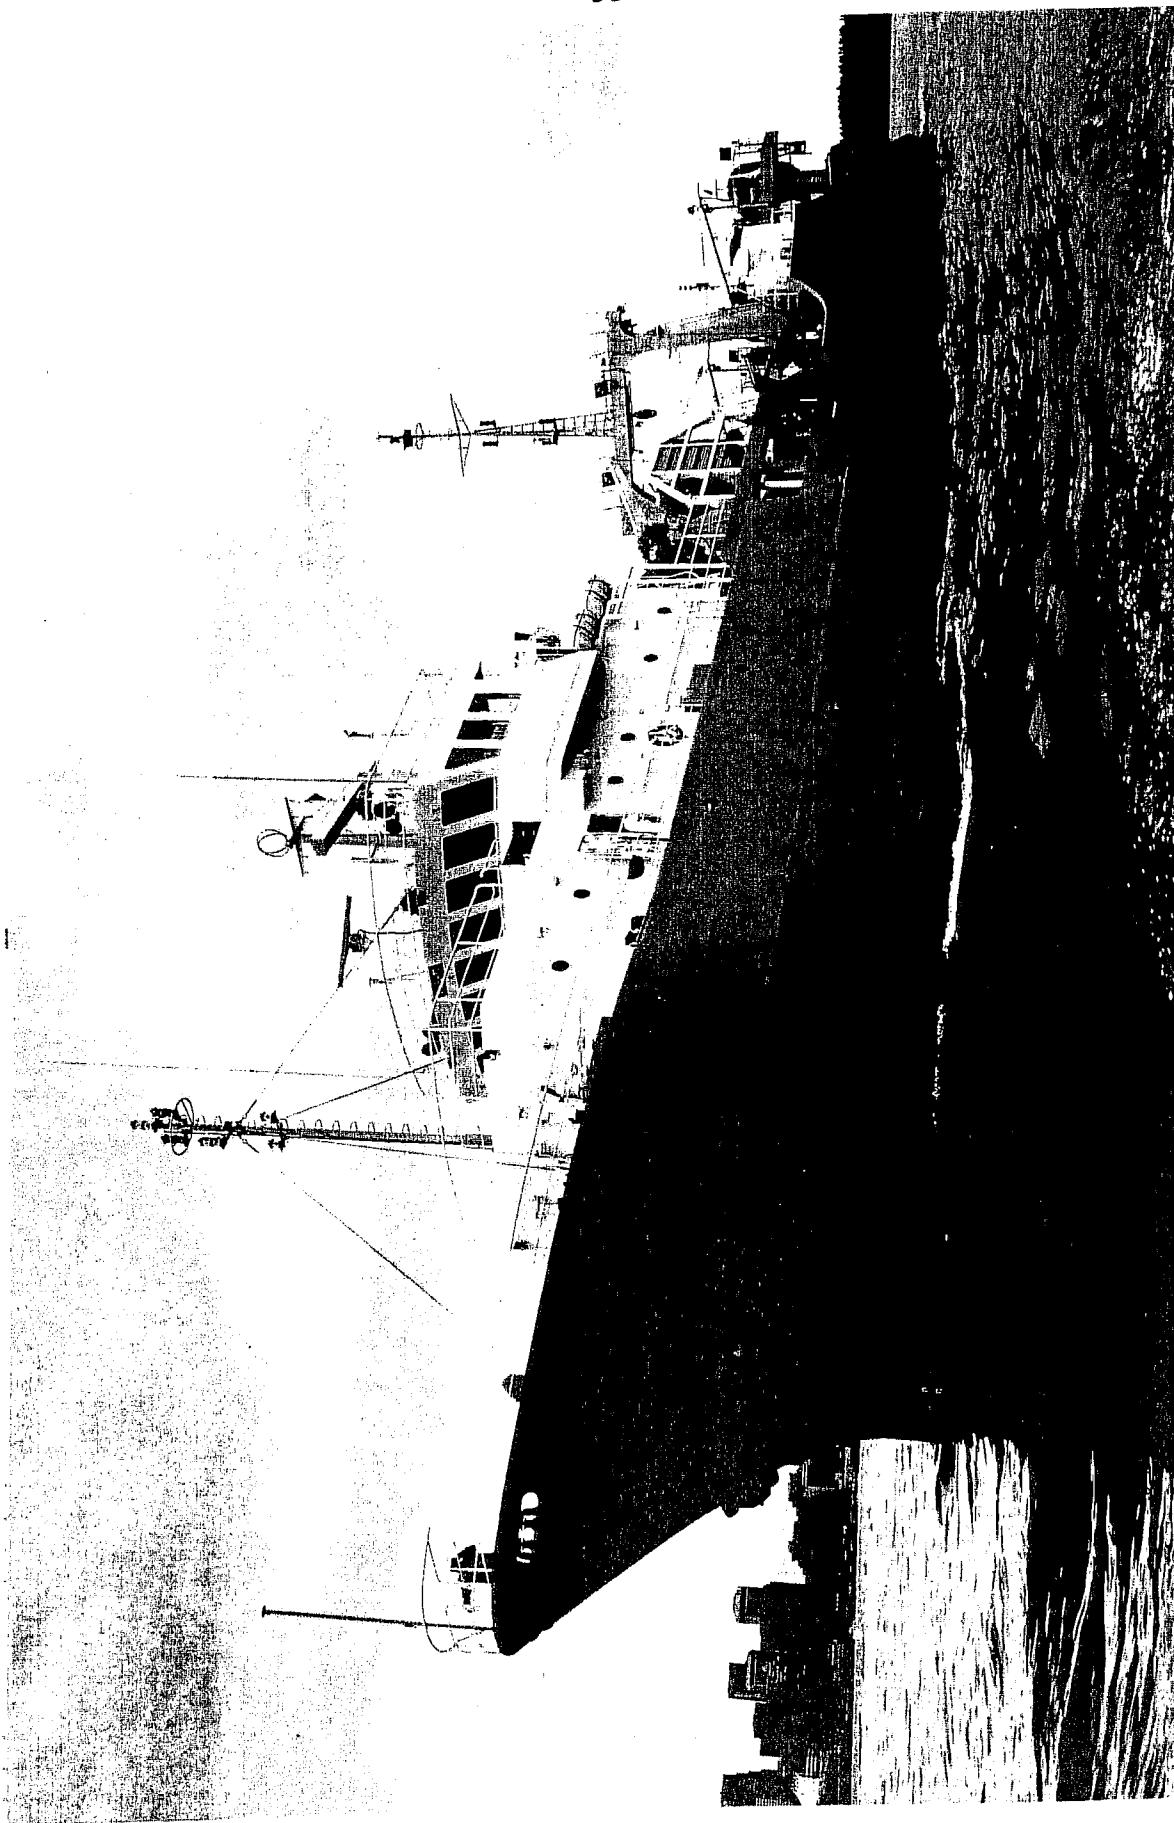

Figure 6. The CSS W.E. Ricker of the Pacific Biological Station

Appendix 1. Nutrient samples taken by Ocean Climate Chemistry Division of IOS (OCC) during OCMS cruises as well as their own. Although there is usually some similarity between the Cruise ID of OCMS cruises and those of OCC, there are differences. They are noted when they occur. Dates represent those of observations. Samples were routinely frozen before 1987 (Cruise 8702) but were subsequently analyzed aboard by the use of Autoanalyzer. In 1991 due to the unavailability of the Autoanalyzer samples were frozen. "?" represent samples almost certain to be frozen but not positively so. Nominal depths denote maximum depths (wire-out) of samples. Abbreviations for ships:  
 P = Parizeau; E = Endeavour; T = John P. Tully. Information supplied by F. Whitney of OCC.

CRUISE ID	YR	MO	DY	SHIP	DEPTH (M)	STN STORAGE	NOMINAL	REMARKS
