Canadian Data Report Of Hydrography and Ocean Sciences

Data reports provide a medium for the documentation and dissemination of data in a form directly useable by the scientific and engineering communities. Generally, the reports contain raw and/or analyzed data but will not contain interpretations of the data. Such compilations commonly will have been prepared in support of work related to the programs and interests of the Ocean Science and Surveys (OSS) sector of the Department of Fisheries and Oceans.

Data reports are not intended for general distribution and the contents must not be referred to in other publications without prior written authorization from the issuing establishment. The correct citation appears above the abstract of each report. Data reports are abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out of stock reports will be supplied for a fee by commercial agents.

Regional and headquarters establishments of Ocean Science and Surveys ceased publication of their various report series as of December 1981. A complete listing of these publications is published in the *Canadian Journal of Fisheries and Aquatic Sciences*, Volume 39: Index to Publications 1982. The current series, which begins with report number 1, was initiated in January 1982.

Rapport statistique canadien sur l'hydrographie et les sciences océaniques

Les rapports statistiques servent de véhicule pour la compilation et la diffusion des données sous une forme directement utilisable par les scientifiques et les techniciens. En général, les rapports contiennent des données brutes ou analysées, mais ne fournissent pas d'interprétation des données. Ces compilations sont préparées le plus souvent à l'appui de travaux liés aux programmes et intérêts du service des Sciences et levés océaniques (SLO) du ministère des Pêches et des Océans.

Les rapports statistiques ne sont pas destinés à une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans une autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports statistiques sont résumés dans la revue *Résumés des sciences halieutiques et aquatiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés sont fournis contre rétribution par des agents commerciaux.

Les établissements des Sciences et levés océaniques dans les régions et à l'administration centrale ont cessé de publier leurs diverses séries de rapports en décembre 1981. Une liste complète de ces publications figure dans le volume 39, Index des publications 1982, du *Journal canadien des sciences halieutiques et aquatiques*. La série actuelle a commencé avec la publication du rapport numéro 1 en janvier 1982.

ABSTRACT

Lee, A.Y.P. and D.J. Stucchi, 1983. Alberni Inlet CTD Data Report: 1979 to 1981. Can. Data Rep. Hydrogr. Ocean Sci: 15 :326p.

From January, 1979 to September 1981 the Coastal Zone Oceanography Group of the Institute of Ocean Sciences conducted 23 cruises to Alberni Inlet during which a total of 461 CTD (conductivity, temperature and depth) casts were obtained. This report describes the sampling program, the instrumentation used to collect the data, data processing procedures, and data quality. An index to the calibrated data files is also provided. The bulk of the report contains the listing of the CTD and dissolved oxygen data at standard depths.

Key words: Salinity profiles, temperature profiles, Alberni Inlet.

RESUME

Lee, A.Y.P. and D.J. Stucchi, 1983. Alberni Inlet CTD Data Report: 1979 to 1981. Can. Data Re. Hydrogr. Ocean Sci: 15 :326p.

De janvier 1979 à septembre 1981, le Groupe d'océanographie côtière de l'Institut des sciences de la mer a effectué 23 croisières dans l'inlet Alberni au cours desquelles il a enregistré 461 lectures de conductivité, de température et de profondeur (CTD). Le présent rapport décrit le programme de'échantillonnage, les instruments ayant servi à rassembler les données, les méthodes de traitement des données et la qualité de ces dernières. Y figure également un index des fichiers de données etalonnées. La majeure partie du rapport est consacrée à l'énumération des données sur la conductivité, la température, la profondeur et l'oxygène en dissolution aux profondeurs normales.

Mots clés: profils de salinité, profils de température, inlet Alberni.

ACKNOWLEDGEMENTS

The vast majority of the data was collected by the personnel of the Coastal Zone Oceanography Group. We would like to thank R. Bigham, H.J. Freeland, J.H. Meikle, D.G. Knigge-Seiberg, L.A.F. Spearing, and J.A. Stickland for their competent work on this project. We would also like to thank the personnel from the Offshore Oceanography Group and the Frozen Sea Research Group for the valuable assistance provided to us in our time of need. Finally we would like to thank the officers and crew of the C.S.S. Parizeau, C.S.S. Vector, Pandora II and C.F.A.V. Endeavour for their assistance and cooperation.

INTRODUCTION

Alberni Inlet is a 70 km long fjord located on the southwestern coast of Vancouver Island, B.C. (see Figure 1). The fjord comprises two main basins, a 15 km long inner basin of maximum depth 130m which is separated from the outer basin by a double sill at 40m depth. The outer basin is considerably larger, about 40 km in extent with maximum depth of 350m. The outer basin is connected to the Pacific Ocean over a short, shallow 30m sill at the seaward end of Trevor Channel, but the main deep passage to the Pacific is via Junction Passage and Barkley Sound where the depth is approximately 100m all the way to the shelf.

In January 1979, the Coastal Zone Oceanography Group embarked on a study of the continental shelf off southern Vancouver Island. This was one component of the larger Coastal Ocean Dynamics Experiment, CODE, which involved a number of other groups from the institute. Concurrent with CODE, the Coastal Zone Oceanography Group (CZO) initiated an investigation of the exchanges between Alberni Inlet and the adjacent continental shelf. Part of the observation program from the Alberni Inlet Study entailed CTD and dissolved oxygen sampling. Reported here are the CTD and dissolved oxygen content data collected during this study. The entire Alberni Inlet CTD data set is indexed chronologically in Appendix 1.

OBSERVATION PROGRAM

The synoptic program of CTD and dissolved oxygen content measurements was started in January 1979 and was terminated in September 1982. In all, 23 cruises were carried out during this period using a number of different vessels. The stations (A0 to A15) occupied during the survey of Alberni Inlet are shown in Figure 1. Vertical profiles of temperature and conductivity were obtained routinely at all these stations, but hydrocasts for dissolved oxygen content determinations were undertaken only at stations: A1, A2, A5, A7, A9, A12 and A14. Station positions and details of the sampling procedure at those stations are listed in Table 1.

INSTRUMENTATION

The instrumentation used to collect the data consisted of 1) a Guildline Instruments Ltd. model 8700 MK II CTD (conductivity, temperature and depth) probe and control console, 2) a programmable data acquisition system - PRODAS - built by McDonald-Detwiller Ltd., 3) a Hewlett-Packard XY₁Y₂ plotter and, 4) a winch with seven-conductor cable and slip ring assembly.

* Hydro cast for dissolved oxygen samples

+ Salinity calibration samples for CTD

The method of operation is straightforward. The CTD probe is lowered and raised through the water column at the rate of 1 to 1.5 m s^{-1} . Power for the probe is sent down the cable from the control console. The analogue data signals are sent up the cable (one conductor for each sensor plus a signal ground) through the slip ring assembly to the CTD deck unit and data acquisition system. In the CTD deck unit the temperature, conductivity and pressure signals are put through an analogue computer to calculate salinity and then fed to the XY₁Y₂ plotter for a real time plot of the temperature and salinity profile.

The data acquisition system accepts the probe signals directly then multiplexes (1.2 ms/6 channel scan), digitizes (16 bit A-D converter), and sums for an integral number (usually 15) of 60 Hz power supply cycles - this corresponds to a 0.25 second summation. The number of summations, the summation for each sensor and those for the zero and reference voltages are then stored in a buffer, along with header information, and subsequently written onto nine-track (800 BPI) tape. A thermal printer is used to display, in real time, a small portion of this data and any error messages relating to the operation of the data acquisition system. The operation of the data acquisition system relies on a micro-processor which has been programmed to co-ordinate and perform input-output function, summation and diagnostic checks.

For the most part CZO group's CTD system was used, however there were a number of occasions when CZO's CTD system failed and data was obtained by manually digitizing the XY₁Y₂ plots, or when other CTD probes and systems were used. These departures from the norm and other relevant comments about the data are noted in the comments column of Table 2.

DATA PROCESSING

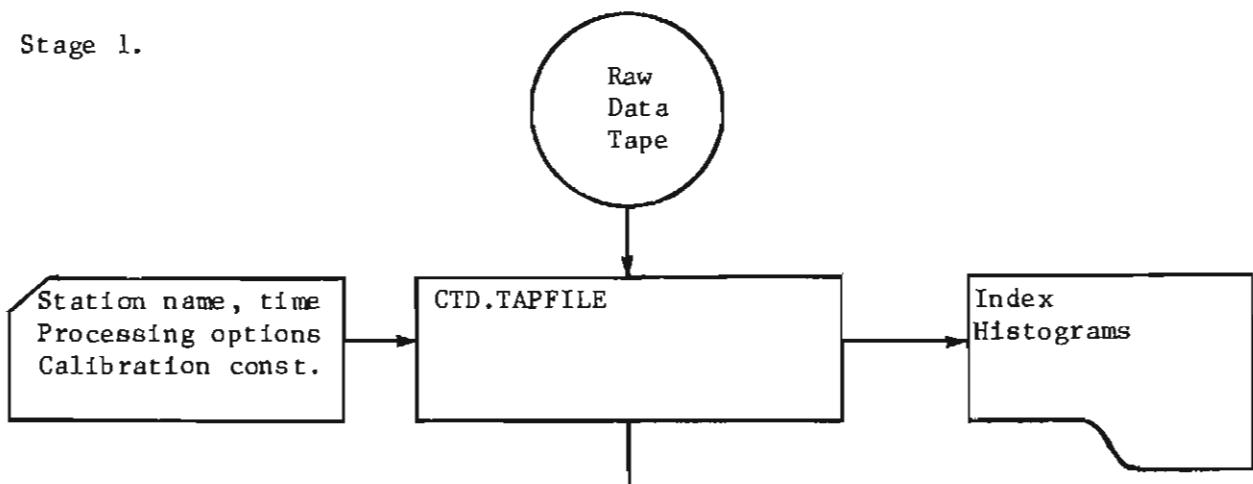

The processing of the data collected with the CTD system was carried out on the Univac 1106 computer at the Institute of Ocean Sciences. The processing is divided into four stages: 1) the conversion of the raw datalogger data, preliminary correction and calibration, and calculation of histograms, 2) manual editing of data, 3) final calibrations and calculations, and 4) data presentation. The data processing scheme is depicted in Figure 2.

The first stage of the processing begins with the conversion of the data written by PRODAS to Univac word format. The data are next converted to voltage units, the reference voltages checked for drift and then preliminary

calibration applied to convert voltage to physical units, of temperature, conductivity and pressure. Because the temperature sensor has a slower response time than the conductivity sensor, the temperature data is corrected for this time response mismatch between the sensors. (This time response correction to the temperature data was only applied when the slow response - 0.25s - thermometer was fitted on the CTD.) The pressure data are checked to ensure that not only do they monotonically increase with time but also that the CTD probe is descending through the water column at a minimum speed of 0.5 m s^{-1} . The data are rejected when the above criteria are not satisfied. The reasons for rejection of these data will be discussed in the next section. Next, salinity is calculated according to the IAPSO "Practical Salinity Scale" (UNESCO 1981a). The corrected data with brief headers are written to mass storage files. Finally first difference histograms of pressure, temperature and salinity are computed and listed out together with data records which have abnormally large first differences.

The second stage is the editing of the mass storage files. The histograms and editing information produced in stage one are used to determine what editing is to be done. Editing is performed manually and usually entails the deletion of data spikes or errors, i.e. data that exceeds predetermined first difference criteria for each sensor. The determination of the editing criteria will vary as the oceanographic state being sampled changes, but as with any editing scheme there will always be a subjective component and some data errors will pass uncorrected. Our experience with these CTD data has shown that the amount of editing performed on each file is small (0 to 5 data errors/profile) with the errors invariably located in the top 10 metres of the profile.

In the third stage, the final calibrations are applied, and sigma-t ($\sigma_t = [\rho(S,T,O)-1000] \text{ [kg m}^{-3}]$) and depth are computed. Sigma-t is computed using the new equation of state for seawater introduced by the UNESCO/ICES/SCOR/IAPSO joint panel on oceanographic standards (UNESCO 1981b). Depth is computed from pressure by the numerical integration of the hydrostatic pressure equation. All data is averaged over a one metre depth interval. The calibrated data is then written (unformatted) to nine track, 1600 BPI tape along with a header, which contains all the pertinent information about the particular CTD profile. The header includes: station name, position, time, date, pass number, cruise number, processing options, calibration constants, description of instrumentation, a comment field and any dissolved oxygen content data obtained at the station. Most of

this header information is input in this third processing stage. One record of calibrated data is depicted below.

Depth (m)	Pressure (db)	Salinity (PPT)	Temperature (°C)	Sigma-t (kg m ⁻³)	Conductivity Ratio
--------------	------------------	-------------------	---------------------	----------------------------------	-----------------------

The fourth and final stage of processing consists of a number of different programs which are used to present and display the data. Computer programs are available to produce profile plots, temperature-salinity (TS) diagrams, displacement plots, and various listing programs. The publication listing program was used to produce the standard depth listings contained in this report.

DATA QUALITY

Calibrations in the laboratory were performed on the temperature sensor. These consisted of either ice point determinations or calibrations over a range of temperatures using the Frozen Sea Research Group's temperature bath and 3 NRC thermistors as standards or Offshore Oceanography Group's temperature bath. Checks on the conductivity circuit were performed by replacing the conductivity cell with a decade resistance box and running through the resistance range of interest.

The field checks of the temperature and conductivity sensors were obtained by placing a Niskin water sampling bottle with reversing thermometers on the 7 conductor cable, several metres above the probe. The probe and bottle were then positioned at a depth where vertical gradients in temperature and salinity were small. After a suitable stabilization period the bottle and thermometers were tripped, and simultaneously, the data from the data acquisition system were noted. Salinities determined from the bottle sample, and temperatures from reversing thermometers were then compared with those computed from the CTD data. Differences were calculated between the Guildline CTD data and in situ bottle data. The mean salinity difference or offset was then incorporated as a correction to the salinity in the third data processing stage. The mean temperature difference or offset was not used to correct the data because of the relatively large uncertainty in the reversing thermometer temperature ($\pm 0.02^{\circ}\text{C}$) and the large scatter in these differences (see Figure 3). The reversing thermometer data were used as an indicator for gross calibration shifts in the CTD temperature sensor. The statistics for the 2 years of in situ calibration data (153 samples) for different CTD probes and different temperature sensors indicate a mean temperature difference (CTD temperature-reversing thermometer reading) of -0.01°C with a sample standard deviation of $\pm 0.05^{\circ}\text{C}$ - five times as large as

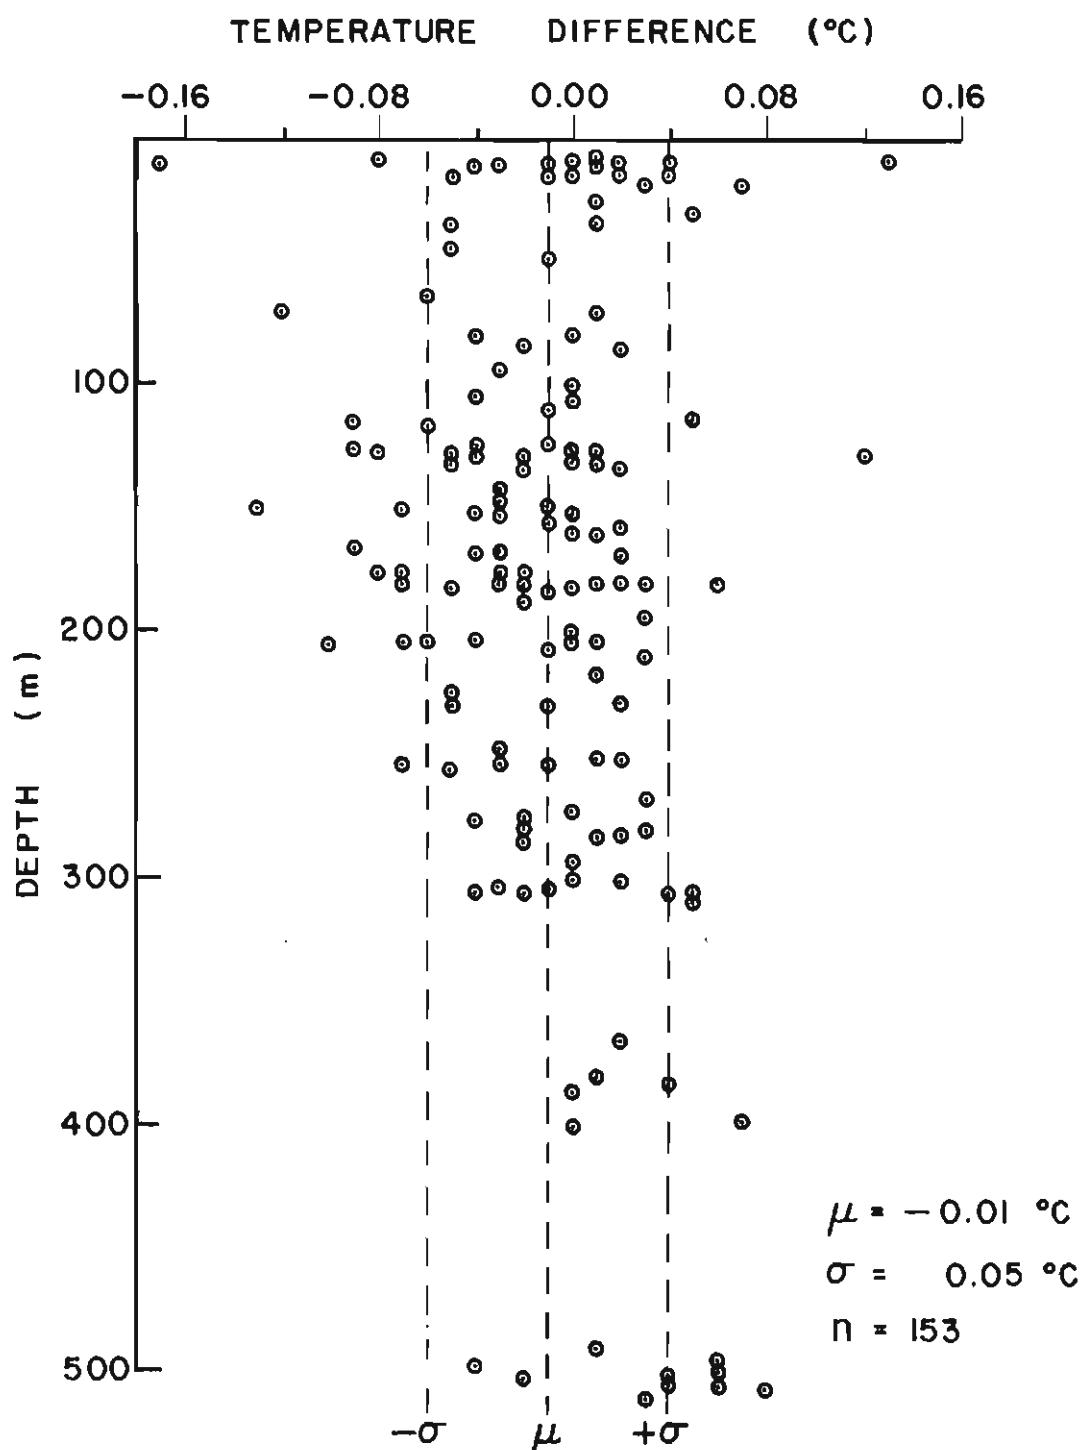

Figure 3 Temperature differences (Guildline CTD - reversing thermometers) for the period January 1977 to September 1981.

the mean. The 90% confidence interval for the mean is -0.02 to +0.00°C which indicates that the computed mean of -0.01 is not significantly different from a zero mean at 90% level of significance. The plot of temperature differences versus depth in Figure 3 indicates that there may be a bias with depth, however the large scatter in these data makes a depth dependent correction unwarranted. The statistics for the salinity differences (corrected CTD salinity - in situ bottle salinity) for different CTD probes and different conductivity sensors (169 samples) show no mean offset because the salinity data for each cruise have been corrected for the mean offset observed for that cruise (Figure 4). The mean salinity offsets for each cruise were in the range of 0.006 to 0.092 ‰. The sample standard deviation of 0.013 ‰ indicates that the scatter of the salinity differences about the offsets is small. The plot of salinity differences versus depth in Figure 4 also indicates a possible bias with depth, however even if the depth dependence of the salinity difference is significant the correction would be small (~0.006 ‰ at 500m. The temperature and salinity differences plotted in Figures 3 and 4 are not exclusively from samples taken in Alberni Inlet, included are the calibration samples from the offshore stations (CODE), Nootka Sound Inlets and Knight Inlet.

An important aspect of these CTD data that is relevant to the discussion of data quality is related to the variable descent rate of the CTD probe caused by ship motion. In the protected waters of Alberni Inlet ship motion is not significant but in the outermost oceanic stations where sea swells are present (A10, A14, A15) ship motion is an important consideration. It has been observed that when the CTD probe slows down and reverses its descent, positive going spikes or loops appear in the salinity signal. These spikes have been observed to be as large as 0.15 ‰ in regions where the vertical gradients are large. Since we did not know how to correct the conductivity signal the data were discarded. The criterion used to discard the data was based on the observation that these salinity spikes or loops occurred whenever the probe descent rate approached zero. Consequently, whenever the descent rate was less than 0.5 m s^{-1} the data were discarded. This descent rate cut-off criterion, though arbitrarily chosen, eliminated or reduced substantially this spiking problem. Unfortunately, it did not completely eliminate the salinity spikes.

Another problem area of the CTD data is in the near surface region (0 to 5m). Not only do most of the data spikes occur in this region but there are many instances when unrealistically large density inversions occur, and it is not obvious how they should be corrected. These inversions may result from problems with the CTD and/or the manner in which profiles were taken from the vessels. It has been noted that if the conductivity cell is not properly cleaned and soaked prior to each cast large conductivity readings

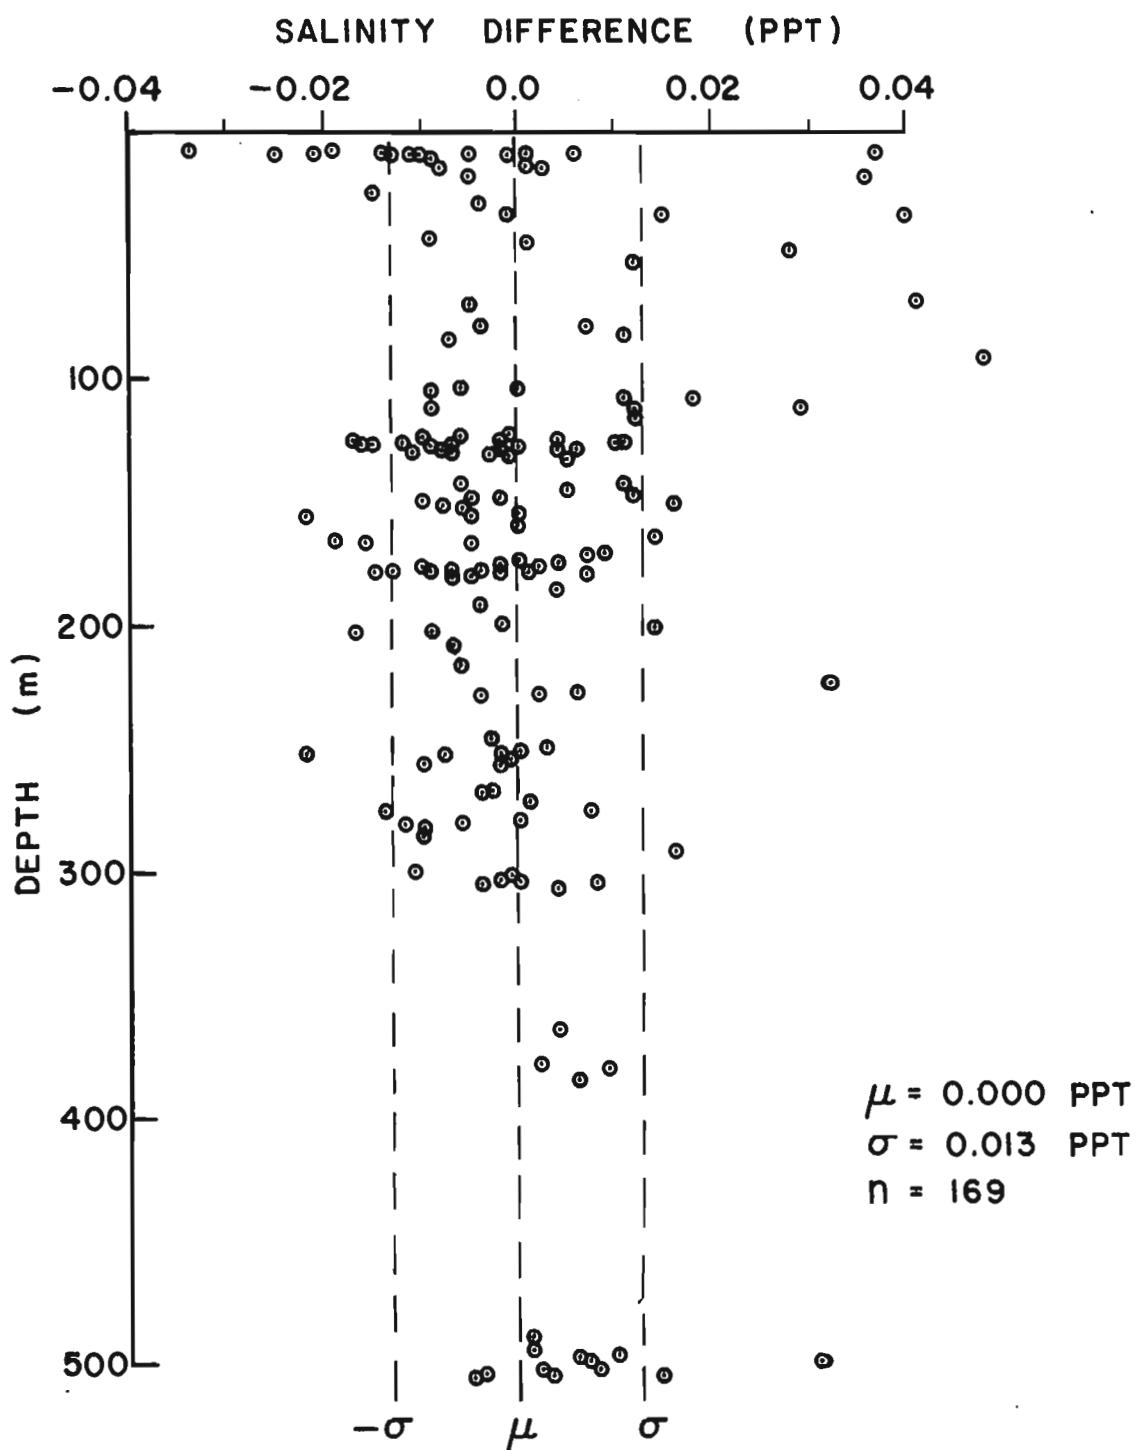

Figure 4 Salinity differences (corrected Guildline salinity - in situ bottle salinity) for the period from January 1977 to September 1981.

may occur at the start of the cast. Furthermore, during the cruises with the C.S.S Parizeau and C.S.S. Vector the profiles were obtained from the stern directly in the propeller wash from these vessels. The constant stirring of the stratified surface waters by the propellers and the presence of bubbles in the wash may also have contributed to the spurious readings. The listings of data have been blanked out near the surface for these profiles in which these near surface inversions were observed.

The statement of data accuracy is necessarily ambiguous. The manufacturer states accuracies of $\pm 0.01\text{ ‰}$ for equivalent salinity, $\pm 0.01^\circ\text{C}$ for temperature and $\pm 1.25\text{ db}$ for pressure. From the static, in situ calibrations the accuracy of the salinity is only slightly poorer at $\pm 0.013\text{ ‰}$. It is difficult to comment upon the accuracy of the temperature data using the static, in situ calibrations because the large standard deviation of the temperature differences. This large scatter is probably due to the limited accuracy ($\sim 0.02^\circ\text{C}$) of the reversing thermometers. When the CTD probe is descending through regions of large vertical gradients, and especially when the descent rate is varying due to ship motion the accuracy of the data deteriorates considerably, and the accuracies stated by the manufacturer are optimistic. Data quality has been observed to be poor in the top few metres of a number of profiles, but in the vast majority of profiles no abnormalities are present. Consequently it is difficult to assign an accuracy to these measurements given the transient nature of the problem. The problem of time response mismatch between the temperature and conductivity sensor has been addressed by applying a correction to the temperature data. This correction has improved the data but it has not completely resolved the spiking problems probably because the time response mismatch between the sensors is a function of probe descent rate which usually is not constant. The problem associated with variable descent rate has been reduced by rejecting data where the descent rate was less than 0.5 m s^{-1} . This has eliminated some obvious inversions in the data, but many still remain. The problem of dynamic calibration of the temperature and conductivity sensor still remains.

DISSOLVED OXYGEN DATA

Samples for dissolved oxygen content determination were obtained at standard depths using Niskin water sampling bottles. Samples were drawn, pickled and analyzed within 24 hours. A modified Winkler titration method (Strickland and Parsons 1965) was used to determine the dissolved oxygen content of the samples. Two titrations were done on each sample giving an accuracy of about $\pm 0.02\text{ ml/l}$ under ideal laboratory conditions.

The dissolved oxygen content (in units of ml/l) data is presented together with the CTD data at the appropriate depths.
