Canada

Canadian Data Report Of Hydrography and Ocean Sciences

These reports provide a medium for the documentation and dissemination of data in a form directly useable by the scientific and engineering communities.

Generally, the reports will contain raw and/or analyzed data but will not contain interpretations of the data. Such compilations will commonly have been prepared in support of work related to the programs and interests of the Ocean Science and Surveys (OSS) sector of the Department of Fisheries and Oceans.

Data Reports are produced regionally but are numbered and indexed nationally. Requests for individual reports will be fulfilled by the issuing establishment listed on the front cover and title page. Out of stock reports will be supplied for a fee by commercial agents.

Regional and headquarters establishments of Ocean Science and Surveys ceased publication of their various report series as of December 1981. A complete listing of these publications and the last number issued under each title are published in the *Canadian Journal of Fisheries and Aquatic Sciences*, Volume 38: Index to Publications 1981. The current series began with Report Number 1 in January 1982.

Rapport statistique canadien sur l'hydrographie et les sciences océaniques

Ces rapports servent de véhicule pour la compilation et la diffusion des données sous une forme directement utilisable par les scientifiques et les techniciens.

En général, les rapports contiennent des données brutes ou analysées mais ne fournissent pas d'interprétations des données. Ces compilations sont préparées le plus souvent à l'appui de travaux reliés aux programmes et intérêts du service des Sciences et Levés océaniques (SLO) du ministère des Pêches et des Océans.

Les rapports statistiques sont produits à l'échelon régional mais sont numérotés et placés dans l'index à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page de titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

Les établissements des Sciences et Levés océaniques dans les régions et à l'administration centrale ont cessé de publier leurs diverses séries de rapports depuis décembre 1981. Vous trouverez dans l'index des publications du volume 38 du *Journal canadien des sciences halieutiques et aquatiques*, la liste de ces publications ainsi que le dernier numéro paru dans chaque catégorie. La nouvelle série a commencé avec la publication du Rapport n° 1 en janvier 1982.

PREFACE

To manage Canadian West Coast waters competently, there is a fundamental requirement to review the sufficiency and suitability of the available scientific data for many purposes - such as engineering design, regulation, assessment, planning, research and monitoring. We consider this review to consist of three phases: (i) the cataloguing, mapping and methods-appraisal of all existing data sets; (ii) the actual scrutiny of the data themselves and the judgement of their utility for answering management questions; and (iii) the analysis and interpretation of the best of these data.

This inventory, which indexes the physical-oceanographic data of the waters off Vancouver Island and the Queen Charlotte Islands out to the 200-mile fishery limit, is considered a major contribution to phase (i). It has been produced by the Ocean Information Division at the Institute of Ocean Sciences, Department of Fisheries and Oceans, as part of a Data Inventory and Appraisal Program. Contract projects, supervised by government scientists and funded by numerous federal agencies, have examined all known marine-data sets which contain oceanographic information obtained in the areas in question. Evaluation of the data-set quality has been carried out by careful examination of the documentation for methodologies used in sampling and in data storage and analysis.

It is our hope that this inventory will assist you, both in establishing the usefulness of existing data for whatever particular purpose contemplated, and in assessing the confidence to be placed in the interpretations. In addition, it should aid in setting priorities for archiving large quantities of data into the Department's Marine Environmental Data Service (MEDS) in Ottawa.

ABSTRACT

Birch, J. R., L.F. Giovando and D.B. Fissel, 1986. West Coast Data Inventory and Appraisal. Volume 2. Waters West of Vancouver Island and the Queen Charlotte Islands out to the 200-Mile Fishery Limit: Physical Oceanography - Temperature, Salinity, Currents, Water Levels and Waves, 1905 through 1984. Can. Data Rep. Hydrogr. Ocean Sci. 37:(Vol. 2, Part 1, 502 p., Part 2, 324 p.)

This volume is one of a group of catalogues designed to inventory and appraise marine-data sets collected in waters off the west coast of Canada. For user convenience, the group has been organized with its subject matter divided into three general disciplines: physics, chemistry and biology. The format throughout has been structured to facilitate comparison among subjects and regions. With such a large undertaking it is not possible to provide all catalogues at once; the present volume deals with physics only.

Data collection is a continuing process and further updates of these inventories are planned. Readers are requested to submit corrections and additions by writing the issuing establishment. Such corrections and additions will be incorporated in on-line computerized data set listings and will be continuously available upon request.

Key words: British Columbia, Queen Charlotte Islands, Vancouver Island, inventory, salinities, temperatures, currents, water levels, waves.

SOMMAIRE

Birch, J. R., L.F. Giovando and D.B. Fissel, 1986. West Coast Data Inventory and Appraisal. Volume 2. Waters West of Vancouver Island and the Queen Charlotte Islands out to the 200-Mile Fishery Limit: Physical Oceanography - Temperature, Salinity, Currents, Water Levels and Waves, 1905 through 1984. Can. Data Rep. Hydrogr. Ocean Sci. 37:(Vol. 2, Part 1, 502 p., Part 2, 324 p.)

Le présent volume fait partie d'un groupe de catalogues destinés à faire l'inventoire de et à évaluer les séries de données marines sur la côte ouest du Canada. Pour plus de commodité, la question traitée est structurée en trois grandes disciplines: physique, chimie et biologie. Les catalogues sont présentés de façon à faciliter la comparaison entre les sujets et les régions. Le domaine est si vaste qui'il est impossible de fournir tous les catalogues en une seule fois; le présent volume traite seulement la physique.

La collecte des données est un processus permanent et il est prévu de mettre à jour ces inventoires par la suite. Les lecteurs sont invités à soumettre par écrit les corrections et les additions à l'établissement auteur. Ces corrections et additions seront traitées en direct sur ordinateur et incorporées aux listages qui pourront être obtenus sur demande.

Mots-clés: Colombie-Britannique, Queen Charlotte Islands, Vancouver Island, inventoire, salinités, températures, courants, niveaux de la mer, ondes.

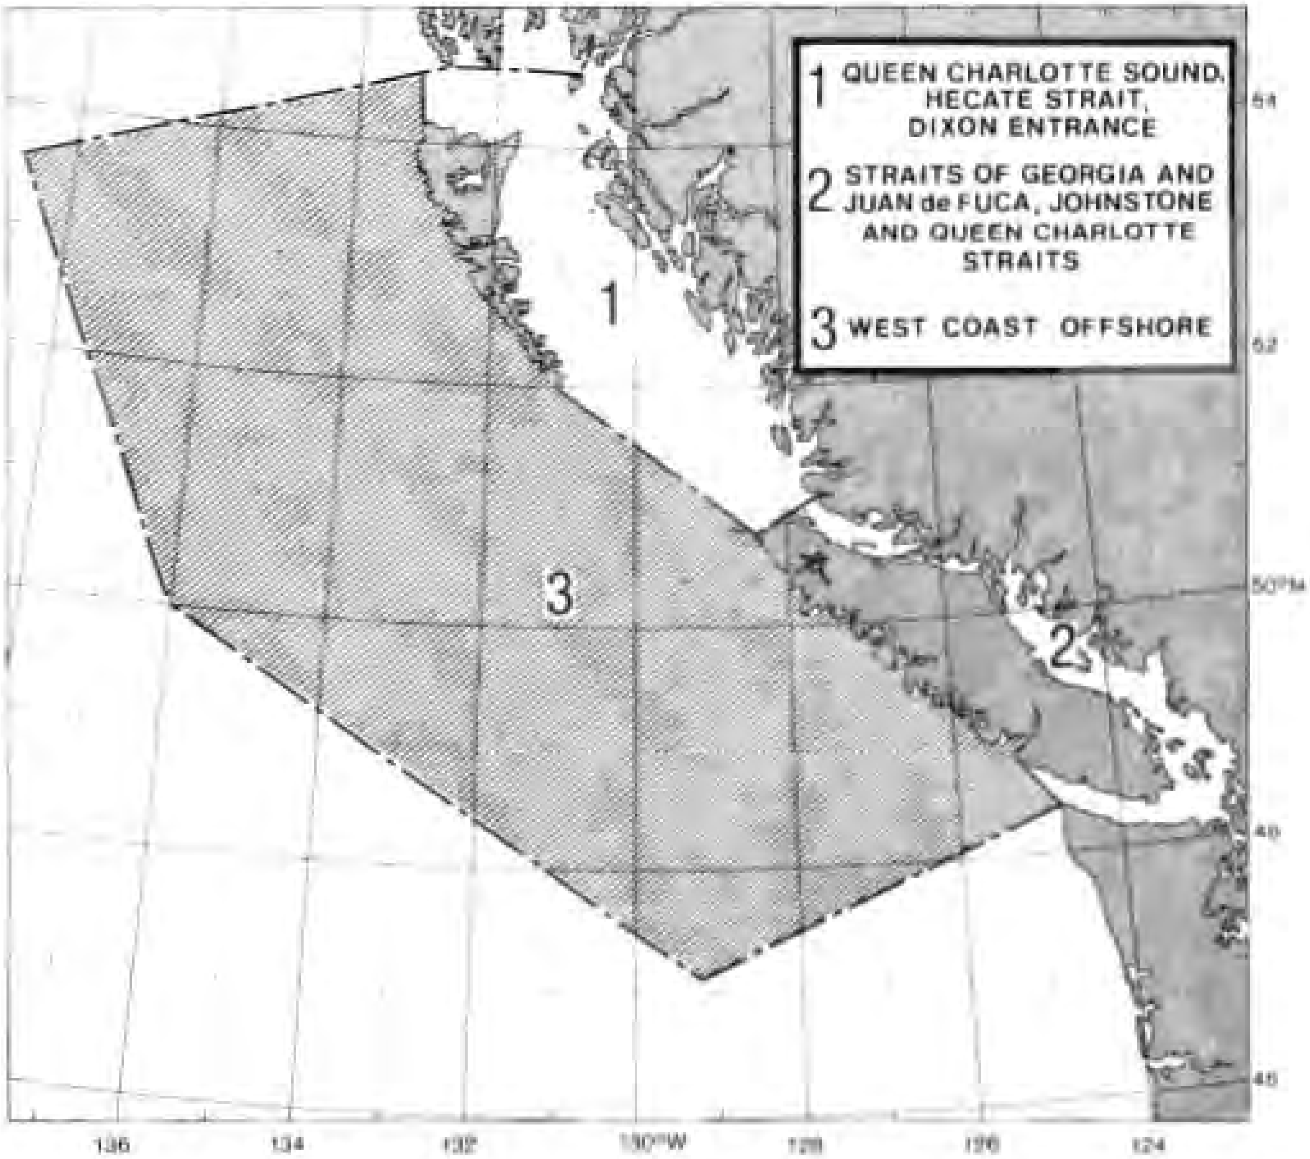
ACKNOWLEDGEMENTS

We thank Mr. G. Floyd for the supervision of ID number assignment. Use was made of the MEDS and NODC data bases, and review reports such as Dodimead (1984). We thank the following for providing information and reviewing the manuscript: Dr. R. Thomson, Mr. D. Stucchi, Mr. A. Douglas, Mr. F. Stephenson, Dr. W. Crawford, Mr. S. Huggett, Dr. R. Macdonald and Dr. H. Freeland of the Institute of Ocean Sciences; Mr. D. Goyette of the Environmental Protection Service; and Mr. A. Dodimead of the Pacific Biological Station, Nanaimo. Ms. L.S.C. Thomson was responsible for technical editing. Special thanks are also due to the following Arctic Sciences Ltd. personnel: Ms. S. Norton, Ms. N. Andrew and Mrs. J. Oberski for preparing the manuscript and Mr. R. Chave for computer program development.

WEST COAST DATA INVENTORY AND APPRAISAL

VOLUME 2 (PART 1)

Waters West of Vancouver Island and the Queen Charlotte Islands out to the 200-Mile Fishery Limit: Physical Oceanography



The study area, 3 shown shaded above, is bounded offshore by the 200-mile fishery limit.

VOLUME 2: Waters West of Vancouver Island and the Queen Charlotte Islands out to the 200-Mile Fishery Limit: Physical Oceanography - Temperature, Salinity, Currents, Water Levels and Waves, 1905 through 1984.

VOLUME ABSTRACT

This inventory represents a catalogue of physical-oceanographic data collected in waters west of Vancouver Island and the Queen Charlotte Islands out to and including the 200-mile fishery limit. Times and locations of measurements are listed and displayed graphically for temperature, salinity, current-meter, water-level, wave and drifter data. Yearly plots showing the locations of all measurements are included, as is an index of references by data-set number. References and sources are listed for all data included in the inventory.

Key words: British Columbia, Queen Charlotte Islands, Vancouver Island, inventory, salinities, temperatures, currents, water levels, waves.

1. INTRODUCTION

In this report, the physical-oceanographic data collected in waters west of Vancouver Island and the Queen Charlotte Islands out to and including the 200-mile fishery limit are catalogued. The information provided includes the time and location of measurements, the parameters measured, and the type of instrumentation used. The data themselves are not included, but a source for, and any reports or references utilizing them, are cited wherever possible. This will enable potential users of the data to determine what is available in their area of interest, what data were collected using a specific measurement technique, and whether those data may be of value.

About 500 data sets collected from 1905 through 1984 are summarized in Table 2.

The station header information is to be added to the ongoing data base at the Institute of Ocean Sciences (IOS), Sidney, B.C. As new data and/or previously-inaccessible data become available, they will be added to a computerized data base maintained by the Ocean Information Division. Information concerning new data sets, older data sets which have not been included, or errors in this catalogue, should be submitted to the Ocean Information Division of the Institute of Ocean Sciences (phone 604-656-8268 or 604-656-8335).

2. STUDY AREA

The study area includes the 200-mile offshore fishery limit as well as the inlets and sounds along the west coast of Vancouver Island and the Queen Charlotte Islands (Figure 1a,b).

The B.C. continental shelf narrows from a width of approximately 80 km off southern Vancouver Island to about 30 km off the Queen Charlotte Islands. Most of the area is considered deep sea, with depths on the order of 2,000-

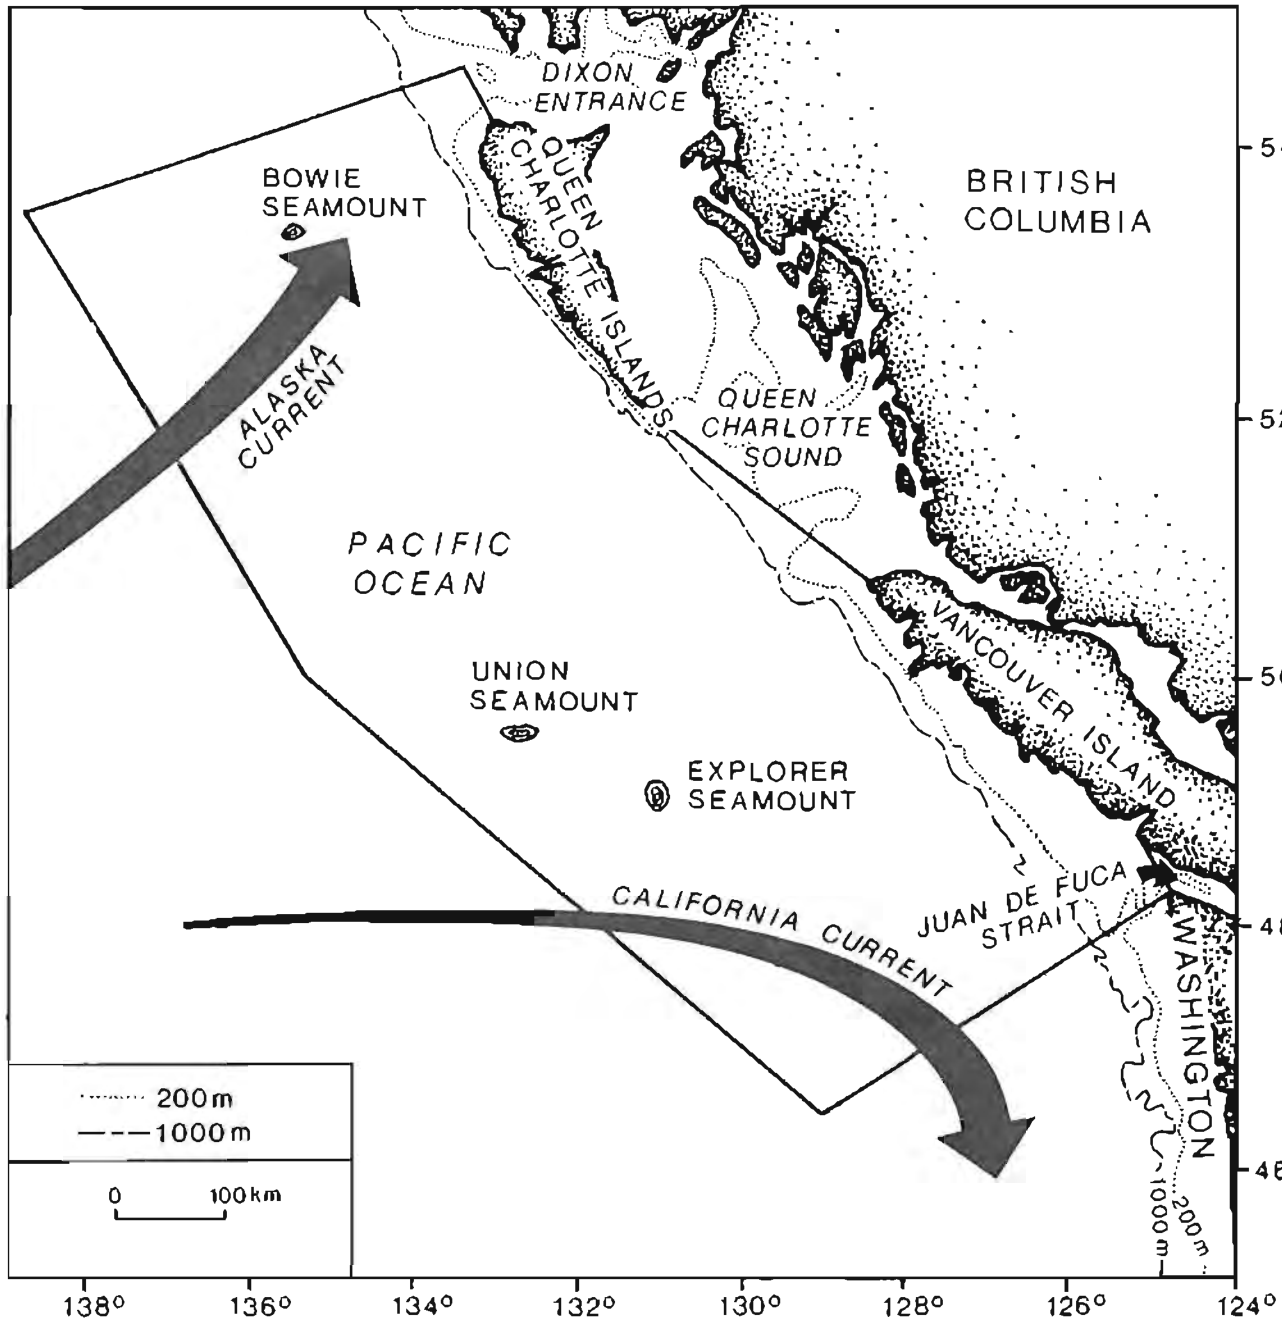


Figure 1a: Major current and bathymetric features offshore British Columbia.

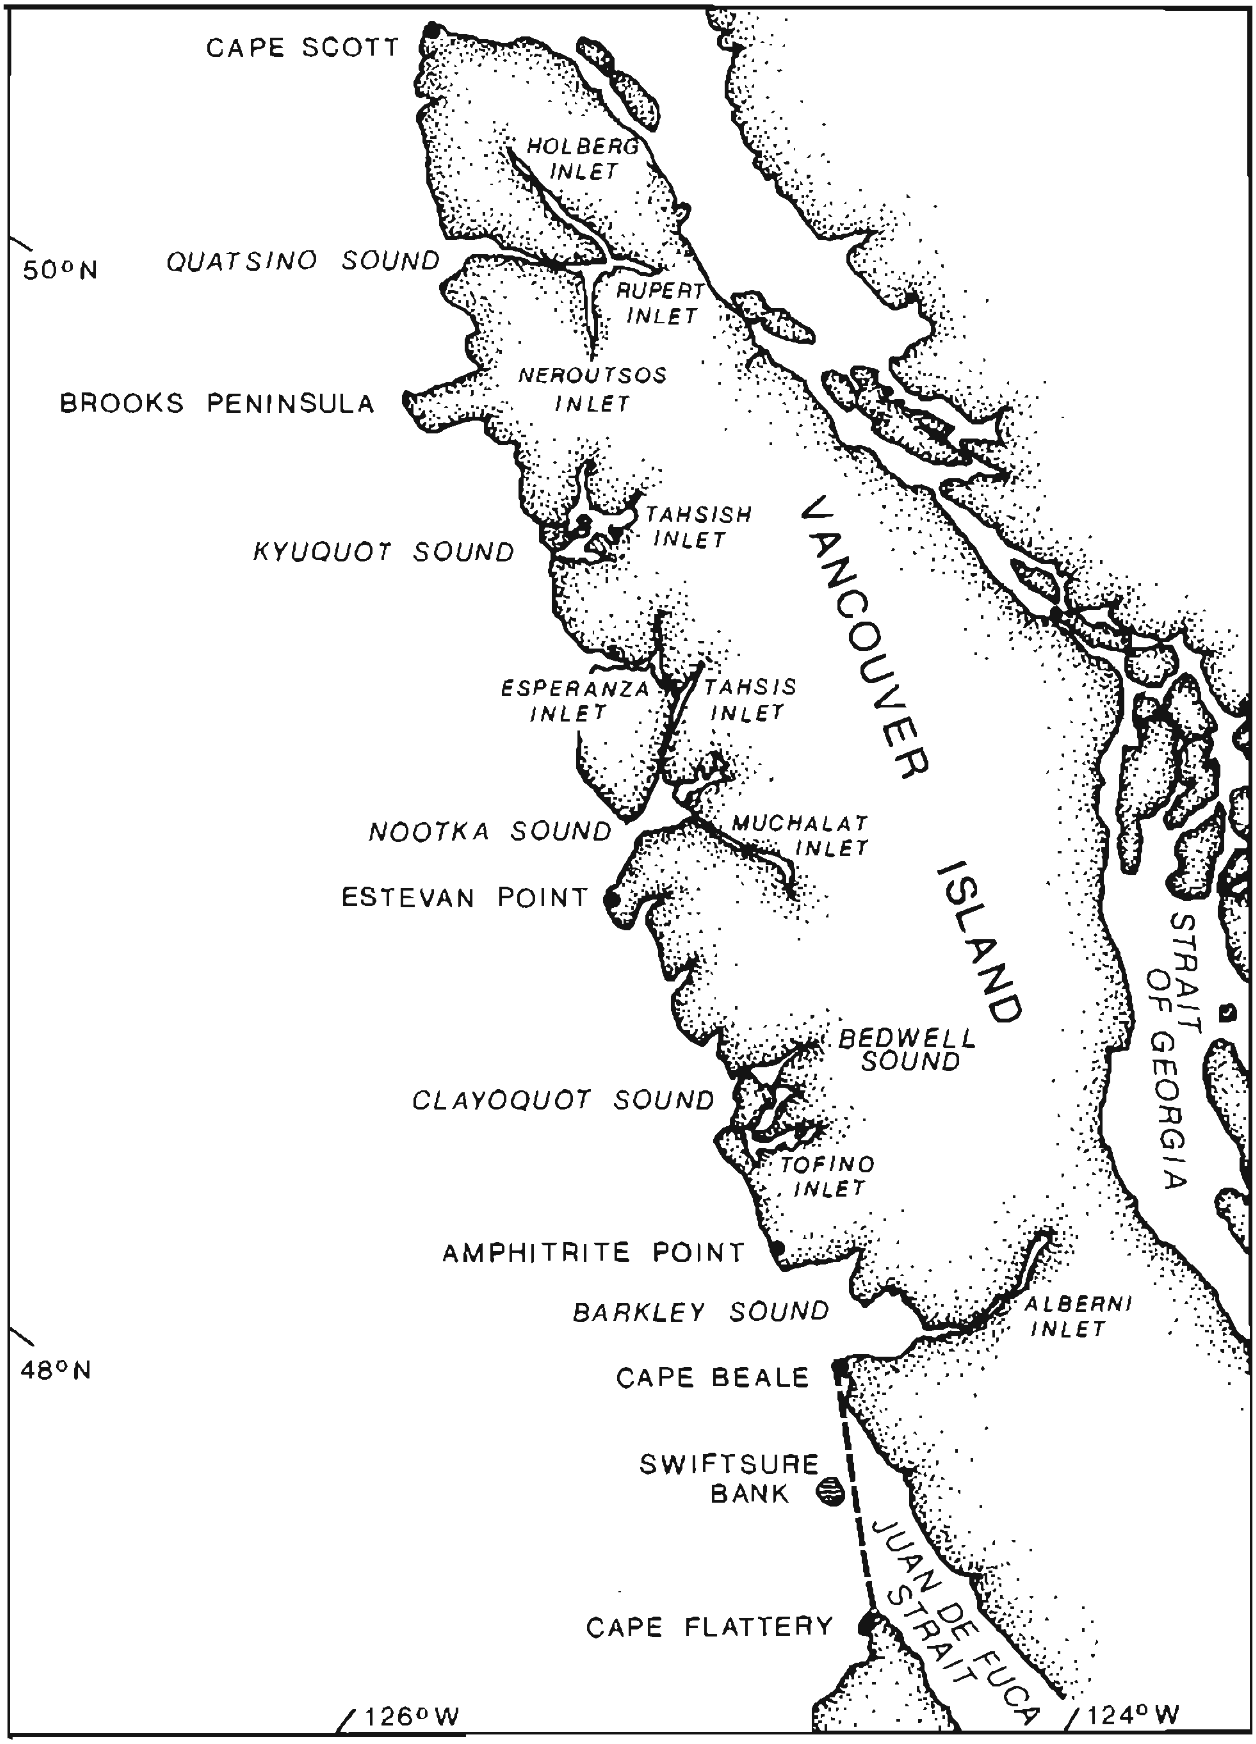

Figure 1b: Placenames for the west coast of Vancouver Island.

3,000 m. A series of seamounts parallels the coast. Although the surrounding water depths are typically 3,000 m, the peaks of these underwater volcanoes rise to within a relatively short distance of the surface (100 m in the case of Bowie Seamount).

Even though the area is bathymetrically a deep-sea region, most surface waters are influenced by coastal runoff. An area of upwelling, most pronounced in summer, extends along the Vancouver Island coast and to the south. The major currents in the area are the Alaska and California currents, which result from a splitting of the Subarctic Current due to a divergence in the prevailing winds. Surface flow along the coast is generally northerly in winter (Davidson Current) and variable in summer. Further information regarding the climatology and oceanography of this area may be found in Thomson (1981a).

3. HISTORICAL DATA

The early oceanographic data consist mainly of water-level measurements. These data commenced in 1905 when a permanent water-level station was established near Tofino.

In 1934, a program was begun which involved the collection of surface temperature and salinity data at shore stations, mainly at lightstations maintained by the Ministry of Transport (MOT) or its organizational predecessors. Since then, nine such sampling stations have been operated in this area for varying periods of time (Section 3.1).

The first oceanographic survey in the area was conducted by the University of Washington in 1932 and consisted of several hydrographic stations offshore of Vancouver Island. In the 1930's, the Pacific Biological Station (PBS) at Nanaimo began cruises in this area. The Pacific Oceanographic Group (POG) was formed in 1946 specifically to study the oceanographic conditions of B.C. waters. The Institute of Oceanography at the University of British Columbia (IOUBC), formed in 1949, has obtained large amounts of data primarily in the Strait of Georgia and the adjoining inlets, but also in some of the inlets along the west coast of Vancouver Island.

The Pacific Oceanographic Group and the University of Washington dominated the oceanographic activity in this area until the mid-1970's when the Institute of Ocean Sciences (IOS), Patricia Bay, was established. Since then, IOS has been largely responsible for oceanographic data collection on the west coast. Independent consulting firms also began conducting oceanographic surveys in the late 1970's. Consultants have carried out studies for both government agencies and commercial companies.

Figure 2 summarizes the level of oceanographic effort, based on the number of bottle/CTD stations per year. Appendix 1 contains a summary of significant dates in the history of west coast oceanography.

3.1 SURFACE TEMPERATURE AND SALINITY FROM SHORE-STATIONS

Daily observations of sea-surface salinity and/or temperature have been made at various west coast locations since 1934. The stations in this study area are summarized in Table 1 and plotted in Figure 3. Most are lightstations presently operated by the Canadian Coast Guard. Cape St. James

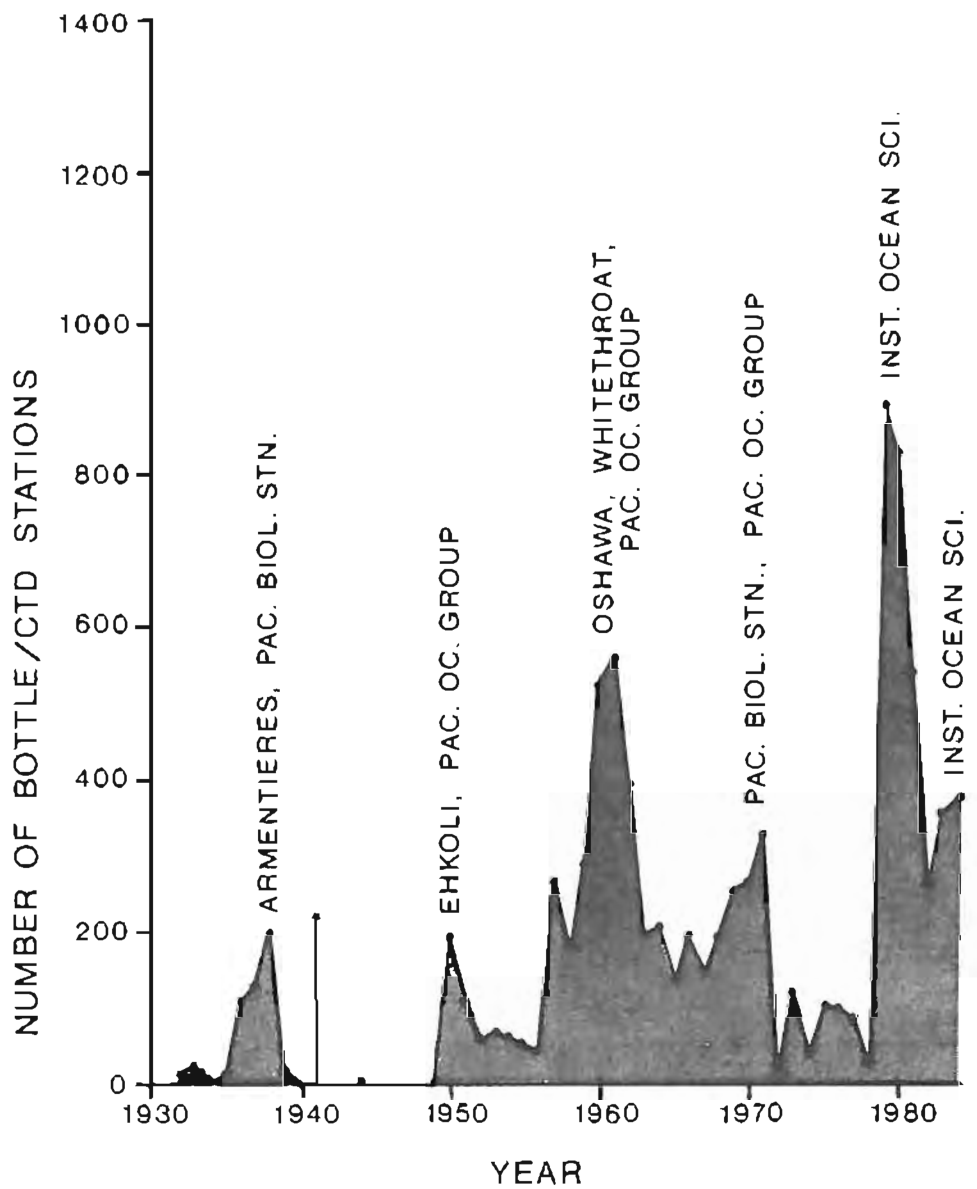

Figure 2: Level of oceanographic effort, based on the number of bottle/CTD stations per year (vessel, agency).

Table 1: B.C. shore stations--West coast Vancouver Island and Queen Charlotte Islands--surface temperature and salinity.

Station	Data Set I.D.	Latitude	Longitude	Period of Operation	Date of Conversion from Salinometer to Hydrometer
Langara Island	36-0004	54°15'	133°03'	Oct. 22/36-Aug. 28/37	N/A
	40-0004	54°15'	133°03'	Mar. 2/40-present, (intermittent 1938-1942)	Sept. 23/69
Cape St. James	34-0002	51°56'	131°01'	July 27/34-present[1]	Jan. 1/71
Kains Island	35-0008	50°27'	128°02'	Jan./35-present	Feb. 1/70
Nootka	34-0006	49°36'	126°37'	Sept./34-June/53	Salinometer used exclusively
Amphitrite Point	34-0007	48°55'	125°32'	Sept./34-present	Feb. 23/70
Swiftsure Bank Lightship	54-0024	48°32'	125°00'	June 18/54 June 30/61	Salinometer used exclusively?
Bamfield	69-0064	48°50'	125°08'	July 12/69-Oct./80[2]	Salinometer used exclusively
Cape Beale	71-0104	48°47'	125°13'	Jan. 9/71-present	Salinometer used exclusively
Port Alberni	41-0008	49°14'	124°49'	May/41-Sept./42	Salinometer used exclusively

[1] Intermittent data from 1938-1942. Temperature readings for Jan. 1939-Dec. 1942 are considered unreliable. Salinity observations were discontinued May 31, 1971.

[2] For the period July 1969-Dec. 1977, temperatures were recorded to the nearest 0.5°C only.

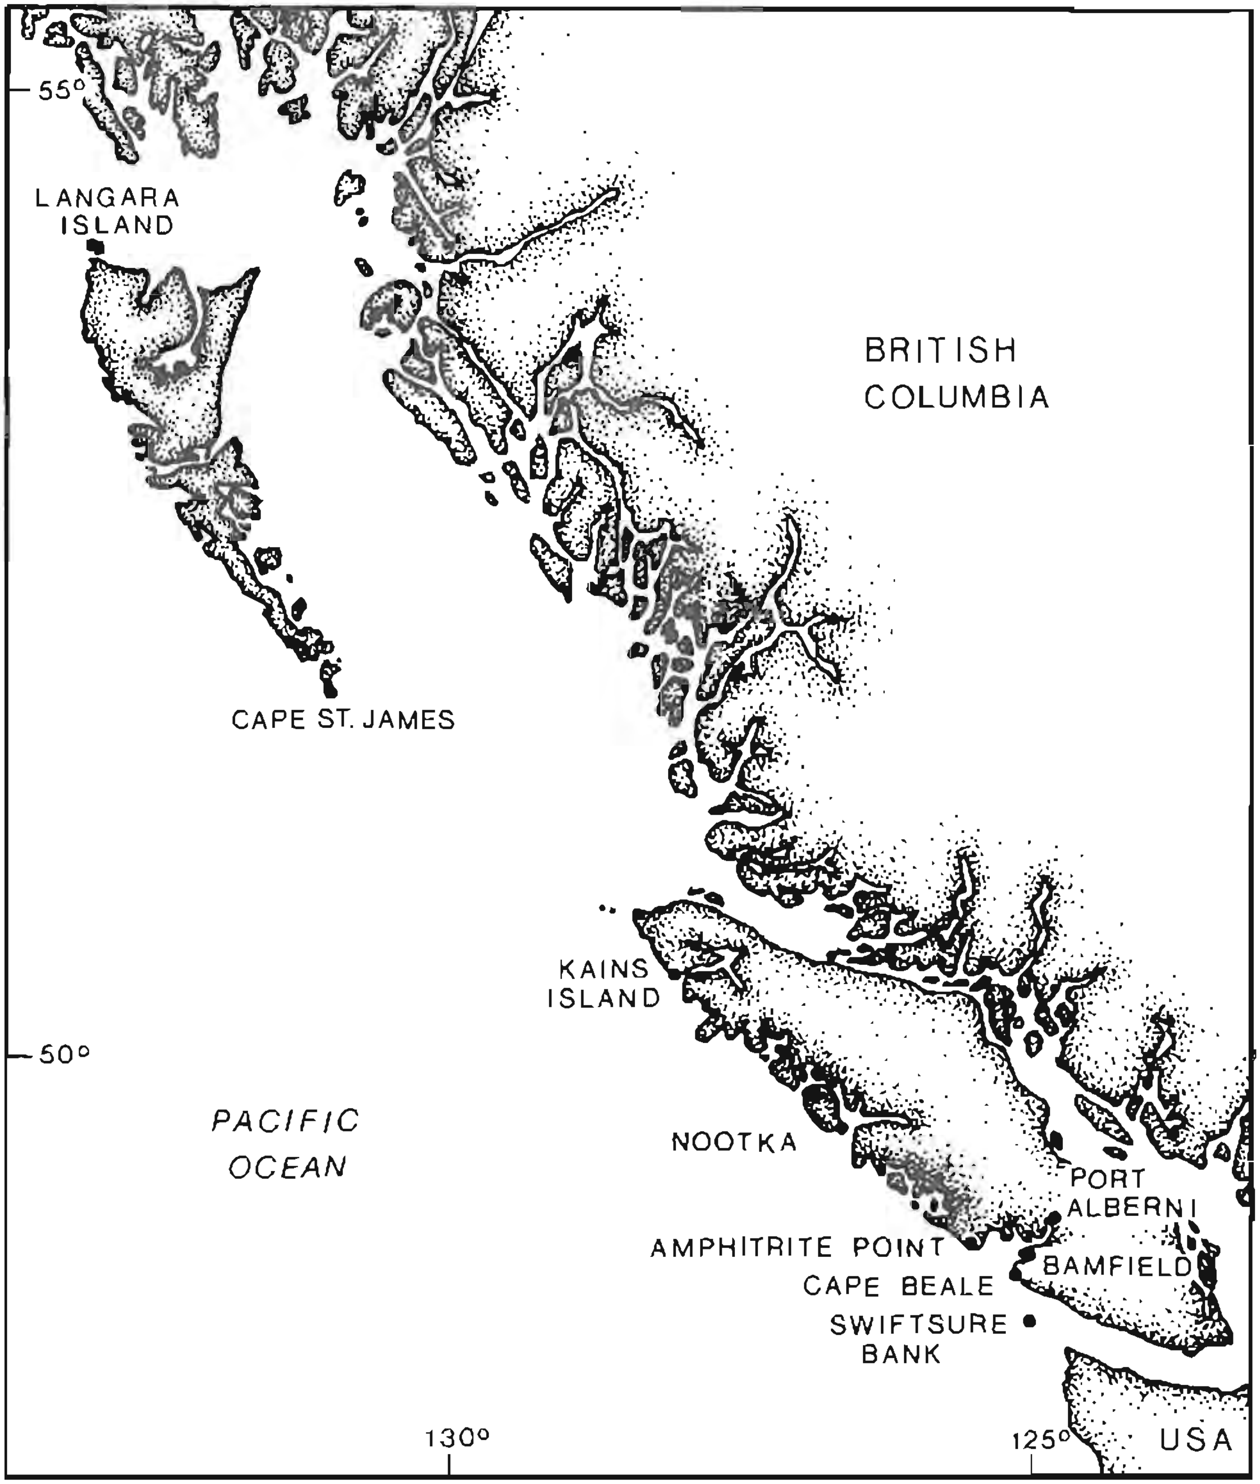

Figure 3: Locations of shore and lightship stations where surface seawater observations have been made. Only those within the limits of this data inventory are shown.

is a meteorological station operated by the Atmospheric Environment Service (AES) and Bamfield is an oceanographic research station. The data have been published in various government reports (e.g.: Hollister, 1960; Hollister and Sandnes, 1972; Wickett and Ballantyne, 1978; Giovando, 1983a, b).

Normally, observations are made within an hour of daytime high tide. Temperature and salinity are measured near surface, at approximately 1 m depth. The water sample for salinity determination is collected using either a bucket or a sampling bottle. The temperature is obtained by "immediate" immersion of a thermometer into the water thus collected.

Following are the estimated accuracies of the various methods used to determine temperature and salinity.

A. Temperature

1.	1934-1936	Mercury thermometer	±0.5°F, ±0.3°C
2.	1937-1939	Red-liquid thermometer	±0.5°F, ±0.3°C
3.	1940-present	Mercury thermometer	±0.3°F, ±0.2°C

B. Salinity

1.	1934-1958	Titration	±0.06°/oo
2.	1959-1969 (approx.)	Conductivity salinometer	±0.03°/oo
3.	Approx. 1969-present	Hydrometer (except as below)	±0.3°/oo
4.	Bamfield & Cape Beale	Inductive Salinometer	±.02°/oo

The actual dates of conversion from salinometer to hydrometer are given in Table 1.

4. GENERAL REPORT LAYOUT AND USER INSTRUCTIONS

4.1 DATA SETS

The data are organized in sets, where each set consists of data of a common type taken on a single expedition or cruise[1], usually by a single institution or organization. Thus, unless otherwise noted, all the data within a single set is assumed to have been collected in a uniform manner and should conform to a common standard of measurement.

Each data set has been assigned an identification number of the form yy-nnnn, where yy = last 2 digits of the year in which the data were collected and nnnn = order of identification for that particular data set for that year. The data-set number is a unique identifier which applies throughout the entire series of inventories; any set identified, for example, as 72-0009 is the same data set no matter where reference to it is made. Gaps may appear in the sequence of data set numbers in this inventory for a particular year, because each data set will not appear in every discipline or geographical area.

[1]In some cases, where similar sampling techniques were used, several cruises have been grouped into one data set. This was done prior to the commencement of this study. In these cases, letter suffixes have been used to differentiate different cruises.

4.2 INVENTORY ORGANIZATION

Table 2 (Section 8) lists all the data sets in the inventory in order of data-set number. It provides a summary description of each set, including the times, areas and methods of measurements. Table 2 also gives a listing of concurrent measurements from other disciplines.

Geographical and measurement-type indexes are in Section 10. The sub-areas in the geographic index are shown on the map in Figure 21. Section 10 also contains an index of references, ordered by data-set number. This index consists primarily of original data reports, although ancillary papers analyzing or discussing the data are listed if they came to our attention.

Measurement locations are plotted in a series of maps in Section 9. Four different maps, all in Lambert Conformal Conic projection, have been used to plot stations. In most cases, the overall map of the entire study area is used, along with one or more of the larger-scale maps. The coastlines have been smoothed, and small islands removed, to avoid clutter. In order to avoid overlap, a displacement of 0.1 inches was required before successive stations were plotted. Map specifications and a key to the symbols on the maps are presented at the beginning of Section 9.

Detailed listings of the times and locations of individual measurements are given in Section 11. There is a separate listing for each data type. The format of the listings is explained at the beginning of Section 11.

Data sets were rated according to the criteria in Section 5. The ratings are listed in Table 2. Appendix 2 contains comments explaining the reasons for low ratings, a list of any errors found in each data set, and any other pertinent remarks concerning the data. The comments are ordered by data-set number.

Section 6 contains a general description of the extent of the data available in this area. Sections 6.1 and 6.2 describe their geographical and seasonal distribution.

4.3 SAMPLE USE OF THE INVENTORY

A typical use of the inventory might be as follows:

1. Examine the maps in Section 9 for measurements during the year(s) of interest, and note the data-set numbers of interest.

2. Refer to Table 2 to find the range of measurement dates, the measurement methods, and accuracies, and data sources.

3. If more specific information is required concerning the timing or location of individual measurements in the set, refer to the listings in Section 11.

4. Consult the reference index in Section 10 for works referring to or using the data.

5. DATA RATING AND APPRAISAL

5.1 TYPES OF DATA

5.1.1 BOTTLE CAST DATA

These data consist of temperature and salinity measurements obtained at discrete depths (ideally the international standard depths) by means of reversing thermometers and sampling bottles. Temperature accuracies of $\pm 0.01°C$ may be achieved by averaging two or more carefully-read, well-calibrated thermometers. Some investigators have used hydrometers ($\pm 0.2^{o}$/oo) and refractometers ($\pm 0.5^{o}$/oo) for the determination of salinity, but up to 1960 salinity was usually obtained by titrating water samples drawn from the bottles; replicate titrations in the hands of a good operator could yield results precise to $\pm 0.01^{o}$/oo. In the 1960's, salinometers measuring salinity via the conductivity of the sample replaced titrations. A precision of $\pm 0.003^{o}$/oo can be obtained with the better instruments, although in the past, systematic errors of $\pm 0.02^{o}$/oo or more could be introduced by variations in the standard water used to calibrate the instruments. New international standards for salinity should eliminate the latter source of error (Lewis and Perkin, 1978).

5.1.2 CTD DATA

CTD data are produced by in-situ profiling instruments variously called STD (salinity-temperature-depth), STP (salinity-temperature-pressure), CTD (conductivity-temperature-depth) or CTP (conductivity-temperature-pressure) profilers. Fundamentally, all are CTP devices; the variations in output and name depend solely upon the degree of internal data processing. All instruments perform the same basic function of measuring (more or less continuously) temperature and conductivity as a function of pressure. The precision achievable with such devices depends upon the individual instrument. The best are capable of a precision of $\pm 0.005°C$ and $\pm 0.005^{o}$/oo, although accuracy in salinity, until recently, was limited to approximately $\pm 0.02^{o}$/oo because of the inconsistencies in salinity standards and definitions (Walker and Chapman, 1973).

5.1.3 BATHYTHERMOGRAPH

The bathythermograph (BT) is a thermo-mechanical device which measures water temperature as a function of pressure. Its information is recorded as a trace, on a smoked-glass or gold-coated slide, which can be read to an accuracy of $\pm 0.2°C$ and ± 2 m depth if the instrument is well calibrated. The BT was widely used in conjunction with bottle casts but has largely been superseded by the CTD. XBT's are the expendable variety. BT data have not generally been compiled, unless they were accompanied by other physical oceanographic measurements. The Pacific Biological Station (PBS), Nanaimo, collected large amounts of BT data beginning in the 1950's and most of these data are on file with the Marine Environmental Data Services Branch of the Department of Fisheries and Oceans (MEDS). The 1977-1981 BT data are published in Dodimead et al. (1979a, b) and Dodimead and Ballantyne (1980, 1984). Earlier BT data have been reported by various authors, including Partlo (1950), Manzer and Neave (1958), Ballantyne (1978) and Douglas and Wickett (1978).

5.1.4 SELF-RECORDING CURRENT METERS

By the 1970's oceanographers could practically and reliably place and recover self-recording current meters in the water column. Meters of this type generally record internally on magnetic tape (in some models photographic film or paper charts are used), or telemeter data to a ship or to a shore receiving station. They generally provide time series of current speed and direction, and may have other sensors (for measuring temperature, pressure or conductivity) mounted as well. Current speed and direction are usually measured by one of two methods: either by a propeller or rotor for measuring speed and a vane for direction sensing, or by measurement of two orthogonal components of the current speed. Component speeds may be measured by propellers, or by electromagnetic or acoustic speed sensors. Directional reference is usually provided by a magnetic compass. Commonly used instruments employing the propeller/rotor and vane system are the Aanderaa, Hydroproducts, Endeco and AMF (vector-averaging) current meters; those employing the component-measuring system include the Cushing and Marsh-McBirney instruments (electromagnetic), the Neil Brown (acoustic), and the Davis-Weller (orthogonal-propeller) instruments.

The precision and accuracy of current meters depend to a great degree both on the design of the instrument, and on the environment in which it is used. Serious problems may be encountered if rotor-type meters are used in the wave zone. Calibration drift and sensor fouling can interfere with satisfactory operation of electromagnetic and acoustic sensors. The sampling frequency and integration period selected for the meter can also affect the accuracy of the record.

5.1.5 PROFILING CURRENT METERS

These current meters provide a series of point measurements of current speed and direction at several depths throughout the water column. Meters used for this purpose are generally of the propeller or rotor and vane design, the oldest common example being the Ekman-Merz meter. Measurements usually are taken from an anchored ship in shallow water. In water too deep for anchoring, a very good positioning system is required to correct for ship movements. Unless repeated profiles were taken so as to form a time series, this type of data was not generally catalogued. Recently Cyclesondes have been used for profiling. This instrument can be fitted to measure currents as well as other parameters, and oscillates vertically up and down a tether, unattended.

5.1.6 CURRENT DRAGS

This method of current determination was employed primarily in the 1950's and early 1960's. A tethered drogue was allowed to drift away from the anchored vessel. The time for a measured length of line to pay out provided a measure of current speed. The direction of flow was estimated from the course of the drogue. The drogues were typically crossed metal vanes, having slight positive buoyancy. Accuracy of speed and direction were seldom discussed. It is believed that speed measurements should be accurate to ± 5 cm/s or better. The accuracy of the direction measurement would vary depending on what method was used. For example, a compass reading should provide a reading to $\pm 5°$ or so, whereas an estimate based on land features and chart would generally not possess such accuracy.

5.1.7 RADAR OR AIRCRAFT-TRACKED DRIFTERS

This type of drifter usually consists of a float (with or without a drogue) and a radar reflector or visual marker. These devices can be tracked visually or by radar from shore or from a ship or aircraft. The accuracies achievable depend upon the tracking system used, and can be very good if a sophisticated system is available. Data of this type are often limited in their coverage in space and time, and may have gaps resulting from bad weather. (Drift card and bottle releases have not been inventoried. See for example Dodimead and Hollister, 1962; Waldichuk 1963; and Pashinski and Charnell, 1979.)

5.1.8 SATELLITE-TRACKED DRIFTERS

Satellite-tracked drifters are a comparatively recent invention, dating from the early 1970's. Widespread use of these devices began after the launch of the Nimbus VI satellite carrying the Random Access Measurement System (RAMS) in 1975. In early 1979, the TIROS-N satellite was launched activating Service ARGOS which is now used to track all such devices.

Both RAMS and System ARGOS compute position from the Doppler shift of a signal transmitted from the buoy to the satellite. On each pass of the satellite the position (and any other data being measured) is received and sent to a ground facility where the data are processed. Both the RAMS and ARGOS systems produce positional accuracies of approximately ± 2 km.

Recently it has become possible to use the LORAN-C system to track drifters.

5.1.9 WATER LEVEL GAUGES

Water-level data are produced mainly by visual observation of tide staffs, by mechanical shore-mounted float-type gauges, or by bottom-mounted pressure gauges. Some early data consist only of observations of the times of high and low water levels. The pressure gauges may be self-contained, or they may consist of a pressure sensor connected to a shore-mounted recording device. The mechanical gauges record by means of a pen on chart paper. The data are usually digitized at hourly intervals, resulting in a record with a resolution of approximately ± 1 cm, and an accuracy of the order of ± 5 to 10 cm. Most pressure gauges use Paroscientific digiquartz sensors with stated resolution/accuracy of 0.001/0.01% full-scale range. The Aanderaa gauges have ranges of 45, 100, 200, 300, 400, 900 and 5,000 psi. The 400 psi is the most common, with the claimed resolution/accuracy being equivalent to $\pm 0.27/2.7$ cm. Sampling intervals generally vary between 5 and 60 minutes. Bottom pressure gauges generally record total pressure (atmospheric plus hydrostatic). In order to extract the water level fluctuations due to changing atmospheric pressure (i.e. the inverted barometer effect), the atmospheric pressure must also be recorded. The Canadian Hydrographic Service (CHS) has collected most of the water-level data; such information was first recorded in 1905.

5.1.10 WAVE RECORDERS

There are three basic types of wave-measuring devices for measurement from a single point:

a) Surface-piercing instruments. These are fixed relative to the water level and measure surface motion using various methods such as the change in capacitance of a vertical wire.

b) Pressure-measuring devices. Ocean waves produce measurable pressure fluctuations beneath them which, under proper conditions, can be related to wave height.

c) Instruments which measure the vertical acceleration of the water surface. When integrated twice in time, the vertical acceleration yields sea-surface elevation relative to the mean.

In shallow water, types a) and b) are generally used, whereas type c) is more suited to deeper waters. Generally, Waverider accelerometer-type buoys have been used in most studies off the Canadian west coast.

5.2 DATA RATING SCALE

5.2.1 RATING CRITERIA

The data appraisal in this inventory is intended to provide the reader with an indication of the quality of each data set and its suitability for comparison with other data sets. The appraisal was based primarily on documentation describing the methods used in collecting and processing the data and on the investigator's estimate of their precision, accuracy and utility. Subsequent analyses of the data were also taken into account, e.g. if errors were found in a particular data set during a subsequent analysis, and the results were published, these results were used in the assessment. Note that a thorough appraisal, requiring investigation of the data and comparisons with other data sets, is beyond the scope of this report.

The information from the sources above was used to assign a numerical rating to each set. The rating system has five levels, defined as follows:

0: Data are found to be wrong.

1: Data are suspect because of ill-defined doubts.

2: Data quality could not be determined due to insufficient support documentation.

3: Data are internally consistent - patterns or trends within the data themselves are probably real, but comparison with other data sets may pose problems.

4: Data are internally consistent and exhibit sufficient standardization that comparison with other 4-rated data should be possible.

If a single rating has been asigned, this number applies to all the data acquired during that cruise. If data sets were of different quality, for example the CTD and current-meter data, then more than one number will be indicated.

5.2.2 ASSIGNMENT OF RATINGS

0 RATING

A data set received a 0 rating if serious deficiencies in technique, or significant systematic errors, occurred. A 0 rating was also assigned if the documentation of the data set lacked essential information (e.g. the positions and times of measurements) which no longer exists.

1 RATING

A data set received a 1 rating if, either as part of a data report or in subsequent analysis and examination, the original or other investigators questioned the validity of the data without pinpointing specific errors. In general, a 1 rating was assigned if a data set exhibited an atypical distribution of values, or indicated unlikely physical processes, but contained no obvious errors. Such data sets require careful examination before use.

2 RATING

Ratings of 2 were given to data sets for which it was not possible to carry out an appraisal. Such cases include:

(i) Proprietary data, whose existence is known, but about which no details are available.

(ii) Data sets for which we were unable to obtain documentation but know that data were collected.

3 RATING

Data received a 3 rating if they were internally consistent within the precision of the methods used to collect the data. Precision refers to the degree of random fluctuation experienced when a measurement is repeated many times, while accuracy is the departure of the measurement (or the mean of a series made under controlled conditions) from the true value. Because oceanographic data are normally taken without replication and under uncontrolled conditions, data taken with instruments of a certain precision will have the same (or poorer) level of accuracy. An exception is the case of a series of temperature-salinity measurements taken within a water body of stable, well-defined characteristics, in which case the mean of the series could provide a measurement more accurate than the precision.

Ratings of 3 were given to all data sets for which no evidence of errors beyond the precision given in Table 2 was found, but which did not satisfy each of the criteria required for a rating of 4 (see below). This is based on data reports and other publications; the actual data were not checked further by the authors of this inventory. In some instances, the instrument and/or precision and accuracy were unknown, but the collecting agency used standardized methods; these data sets were generally awarded a 3 rating when there was no evidence suggesting deficiencies in the data.

Caution should be exercised when comparing two sets of 3-rated data, as their levels of precision may be quite different. The reader should consult both Table 2 and Appendix 2 for precision and error information.

4 RATING

Data received a rating of 4 if: they were measured to the precision available with modern methods described in Section 5.1; they had no evidence of systematic or other errors recorded in the documentation; and they were obtained using measurement instrumentation, methodology and techniques which provide data that can be related to national or international standards.

Since standards tend to change, ratings of 4 were only grudgingly awarded. In many cases, ratings of 3 were assigned because of lack of time and/or sufficient documentation to be certain that a rating of 4 was warranted. Some of these ratings may merit an increase to 4 after further study of the data has been made.

Of all the physical-oceanographic data that were inventoried, the bulk consists of temperature/salinity measurements. Until the early 1960's, water samples were collected by bottle cast and salinities were determined by titration. During most of the 1960's, salinities were generally determined using conductivity bridges. From the late 1960's on, instruments which measured conductivity and temperature in situ (CTDs) became the standard. Salinity was then computed from the temperature, conductivity and pressure values.

CTDs with increased resolution have revealed gradations in salinity where previous chemical analyses indicated homogeneous water. Since both bottle and CTD data may have ratings of 3, caution must be used in any comparison.

Salinity determination depends on a standard. In the past this was $35^{o}/oo$ Copenhagen water. However, variability in the standard, and in the calibration of the instrumentation, often resulted in systematic errors of $0.02^{o}/oo$ or more.

A new, practical salinity scale has recently been adopted (Lewis and Perkin, 1978). A conductivity ratio is measured (the conductivity of the unknown to that of a standard laboratory-produced sample). Waters of the same conductivity ratio at a given temperature and pressure are then defined to have the same salinity. This reduces systematic errors in salinity. However, most of the historical data remains subject to a $\pm 0.02^{o}/oo$ accuracy limitation.

Current-meter data were judged by the instrument characteristics, response, and the deployment methods. The main causes of low ratings are directional errors and contamination by mooring motion and by wave-orbital velocities.

6. SUMMARY OF DATA COVERAGE

6.1 SPATIAL COVERAGE, INCLUDING DATA DISTRIBUTION MAPS

The locations of all measurements inventoried to date are summarized for bottle/CTD (Figure 4), current-meter (Figure 5), water-level (Figure 6), and wave data (Figure 7).

The location maps of all temperature-salinity data have been split into pre-1970 and 1970 through 1984. Prior to 1970, most temperature-salinity data were obtained using bottle casts. Standard depths at which data were collected were 0, 10, 20, 30, 50, 75, 100, 150, 200, 300, 400, 500 and 600 m. Most of the 1970 through 1984 data were obtained using in-situ profiling instruments having vertical resolution on the order of centimetres. Temperature-salinity stations are most concentrated nearshore, over the continental shelf and slope. After 1969, fewer stations were occupied in water depths of greater than 2000 m. The waters adjoining Vancouver Island, particularly off the entrance to Juan de Fuca Strait, have been heavily sampled. The coastal inlets and fjords which have received the most attention are Barkley Sound/Alberni Inlet, Tofino Inlet/Bedwell Sound, Muchalat Inlet, Tahsis Inlet/Zeballos Inlet, and the Quatsino Sound-Rupert/Holberg inlet system.

Most of the current-meter data have been collected since 1970, along the continental shelf and slope (Figure 5). Alberni Inlet and the Quatsino Sound area have been sampled fairly frequently.

The distribution of water-level measurement locations is dominated by coastal and nearshore sites (Figure 6). Some data have been obtained in the shelf/slope region, mainly off Vancouver Island. Data from well offshore have been limited to two sites: Bowie and Union seamounts.

Wave data have been restricted to the continental shelf region off Vancouver Island, except for one site offshore which has been maintained by NOAA since 1976.

6.2 SEASONAL COVERAGE, INCLUDING BI-MONTHLY MAPS

Bi-monthly station maps have been produced for temperature-salinity data (Figures 8-13), and for current and water-level data (Figures 14-19). In each figure the locations of available measurements are plotted according to the two-month period in which the data were obtained, beginning in January-February, and continuing through to November-December. Separate plots are produced for pre-1970 and 1970 through 1984. In general, more data were collected during spring, summer and fall than in winter.

Temperature/Salinity

The waters off Vancouver Island have been sampled during all seasons, as have Alberni Inlet, Muchalat Inlet and the Rupert/Holberg inlet system. Data to the west of the Queen Charlotte Islands are not as plentiful during winter months as they are during the remainder of the year.

Current

Currents over the continental shelf and slope region have been monitored during each bi-monthly period (Figures 14-19). These data were collected recently by IOS. Measurements of currents further offshore have been far less frequent. Currents in Alberni Inlet and the Rupert/Holberg inlet system have also been measured during all seasons.

Water-Level

The seasonal distribution of offshore water-level data is much the same as for current data, since the gauges generally share the same mooring (Figures 14-19). Water levels have been monitored over the continental shelf and slope during each bi-monthly period, both off Vancouver Island and off the Queen Charlottes. Nearshore stations, particularly along the west coast of Vancouver Island and (less frequently) the Queen Charlottes, have resulted in a large data base covering all months.

6.3 CONCLUSIONS

This catalogue of physical-oceanographic data for the waters off British Columbia allows scientists and others to determine the coverage and quality of data in any given area. This report shows that the continental shelf and slope have been heavily sampled, whereas the offshore abyssal waters have received less attention. Coastal studies have generally been site-specific with Alberni Inlet, Muchalat Inlet and the Rupert/Holberg inlet system receiving the most scrutiny.

8. DATA INVENTORY TABLE

Table 2 presents a summary listing of the data sets included in this inventory. The table lists all the data contained in the inventory sequentially by data set number. Water-property, moored current-meter, surface-drift, water-level and wave data are completely catalogued. BT data are not fully catalogued. However their existence has been noted in Table 2, and their general distribution may be deduced from the pattern of stations for a particular cruise, as they were usually collected at and along the track between stations. Over-the-side current measurements of short duration made with fixed-depth or profiling current meters have not been fully inventoried; however, attempts were made to include all such data covering one tidal cycle or more.

Each column of the table contains the following information (symbols and abbreviations used in each column are explained as well):

Column 1 - Data Set I.D.

- contains the data set identifier number, which is of the form yy-nnnn, where yy are the last two digits of the year in which the data set was collected, and nnnn is the sequential number of the data set for that particular year. (The series of data set numbers applies to the whole set of inventories; gaps may appear in the sequence in any one inventory where data sets exist only in other areas or disciplines. A data set which appears in two or more areas or disciplines will have the same number in every case.) Data sets may be sub-divided by the addition of a letter at the end of the number. Sub-divisions have been used when different cruises have been grouped under one I.D. number, or when different programs were conducted on the same cruise. In the case of water-level stations, where data were collected at the same location intermittently or continuously over more than one year, one I.D. number has been used to represent the entire data set.

Column 2 - Ship or collecting agency

- contains the name of the ship (underlined), platform and/or agency.

Column 3 - Dates of measurements

- gives the dates spanning the period during which measurements were taken in the area covered by the inventory. The year is given by the first two digits of the data set number in column 1, unless the measurement period spans more than one year, in which case it is given explicitly. Question marks signify that the dates could not be confirmed, generally due to poor, or lack of, documentation.

Column 4 - Quantity measured

- lists the physical parameters measured in the data set. A quantity followed by a ? means that reference to such a measurement was made but that no supporting details were available. Measurements identified as "Current" are Eulerian current measurements (made at a fixed location); "Current drift" refers to Lagrangian measurements. "Current profile" refers to spot measurements at certain depths at one location.

Column 5 - Instruments or methods used

- lists the instruments and methods used to make the measurements. The entries appear opposite the names of the quantities they measure. A question mark after the entry denotes an assumption, i.e. that the method used was not explicitly stated and that an assumption was made from standard practice at the time. A question mark alone means that the instrument used is unknown.

Column 6 - Estimate of data precision and accuracy

- lists the estimates of the precision (repeatability) and accuracy for each instrument opposite the entry for that instrument in column 5. For instruments of a digital nature, the precision specified is based on the resolution of the instrument. Where possible, estimates made by the original investigators are used. They are entered as two numbers of the form $\pm n_1$, $\pm n_2$ where n_1 is the precision and n_2 the accuracy. Where investigator's estimates were not available, the following special symbols and entries have been used:

[$\pm n_1$,$\pm n_2$]: standard oceanographic methods were used, which would normally result in these values. The techniques and precision/accuracy used in this context are:

BT	[0.2C°,0.2C°]
Reversing thermometer	[0.02C°,0.03C°]
Salinity - Hydrometer	[0.2°/oo,0.2°/oo]
Salinity - Refractometer	[0.5°/oo,0.5°/oo]
Salinity - Titration	[0.02°/oo,0.04°/oo]
Salinity - Bench salinometer	[0.01°/oo,0.02°/oo] [The make/model of salinometer is often unknown, but may be specified in Appendix 2]
High Quality CTD/STD	[±0.005,0.01C°], [±0.005,0.02°/oo]

$\pm n_1$ @: manufacturer's specifications for that instrument.

$\pm n_1$?: an estimate has been given which is questionable for reasons detailed in Appendix 2.

A blank in the column signifies that no information was available and that no reasonable assumption could be made.

Column 7 - Data rating number

- carries the data rating number assigned, as explained in Section 5.

Column 8 - Area

- lists the areas in which the majority of the measurements in the data set were taken. (The areas are defined in Figure 1.)

Column 9 - Concurrent measurements

- lists known measurements in other disciplines taken as part of the data set. Further measurements may have been taken, but were not discovered while cataloguing the physical-oceanographic data, and therefore cannot be listed.

Column 10 - Source or reference

- lists a primary source or reference for the data sets. Data sets held in the data banks at the Marine Environmental Data Service, Ottawa or at the National Oceanographic Data Center, Washington D.C. are identified by, respectively, the entries MEDS# and NODC#, followed by the data bank's identity number. A MEDS number alone does not necessarily mean that the data are not stored at NODC. If MEDS does not have the data, a NODC number is given if they are stored there.

Table 2: Summary listing of data sets.

Data Set I.D.	Ship or collecting agency	Dates of measurements	Quantity measured	Instruments or methods used ?=Unknown	Estimate of data precision and accuracy	Data rating number	Area	Concurrent measurements	Source or reference
05-0005	CHS	Aug. 1905-present	Water level	Lege, Ott	±?,.01 m	3	Tofino		MEDS WL Stn. #8615

9. MAPS

This section contains maps showing the yearly distribution of temperature, salinity, current, water-level, wave, and surface-drift measurements. One overall map and up to three additional sub-maps are used (Figure 20). All are Lambert Conformal Conic projection, with maps 1 through 4 having scales 1:6.085, :2.33, :0.315 and :0.22 million, respectively.

Generally, temperature-salinity and any water-level stations are plotted together. If there were also current-meter data, then the first map will have only temperature-salinity, and the current and water-level data will be displayed on a second map. Wave data have usually been plotted with current and/or water-level data. The overall map generally contains all the stations; the sub-maps provide more detail and several may be used to display station positions in one area.

For some data sets, exact locations are not known. A "?" on the first map is used to indicate the general area, if known.

Some stations plot on land. Wherever possible, the original data source was checked. In most cases, the location is as originally recorded. We have not attempted to guess where the station was actually located, since this may only compound the error.

The legend indicates the following data types:

CM - current-meter data
DRF - drifter data
TS - temperature-salinity data
WL - water-level data
WAVE - wave data

The coastlines have been smoothed and small islands removed. A minimum displacement of 0.05 inch is required for a new station to be plotted, to avoid overlap. Vessel/agencies in the legend are abbreviations. Note that cruise station symbols may be different on two different maps.

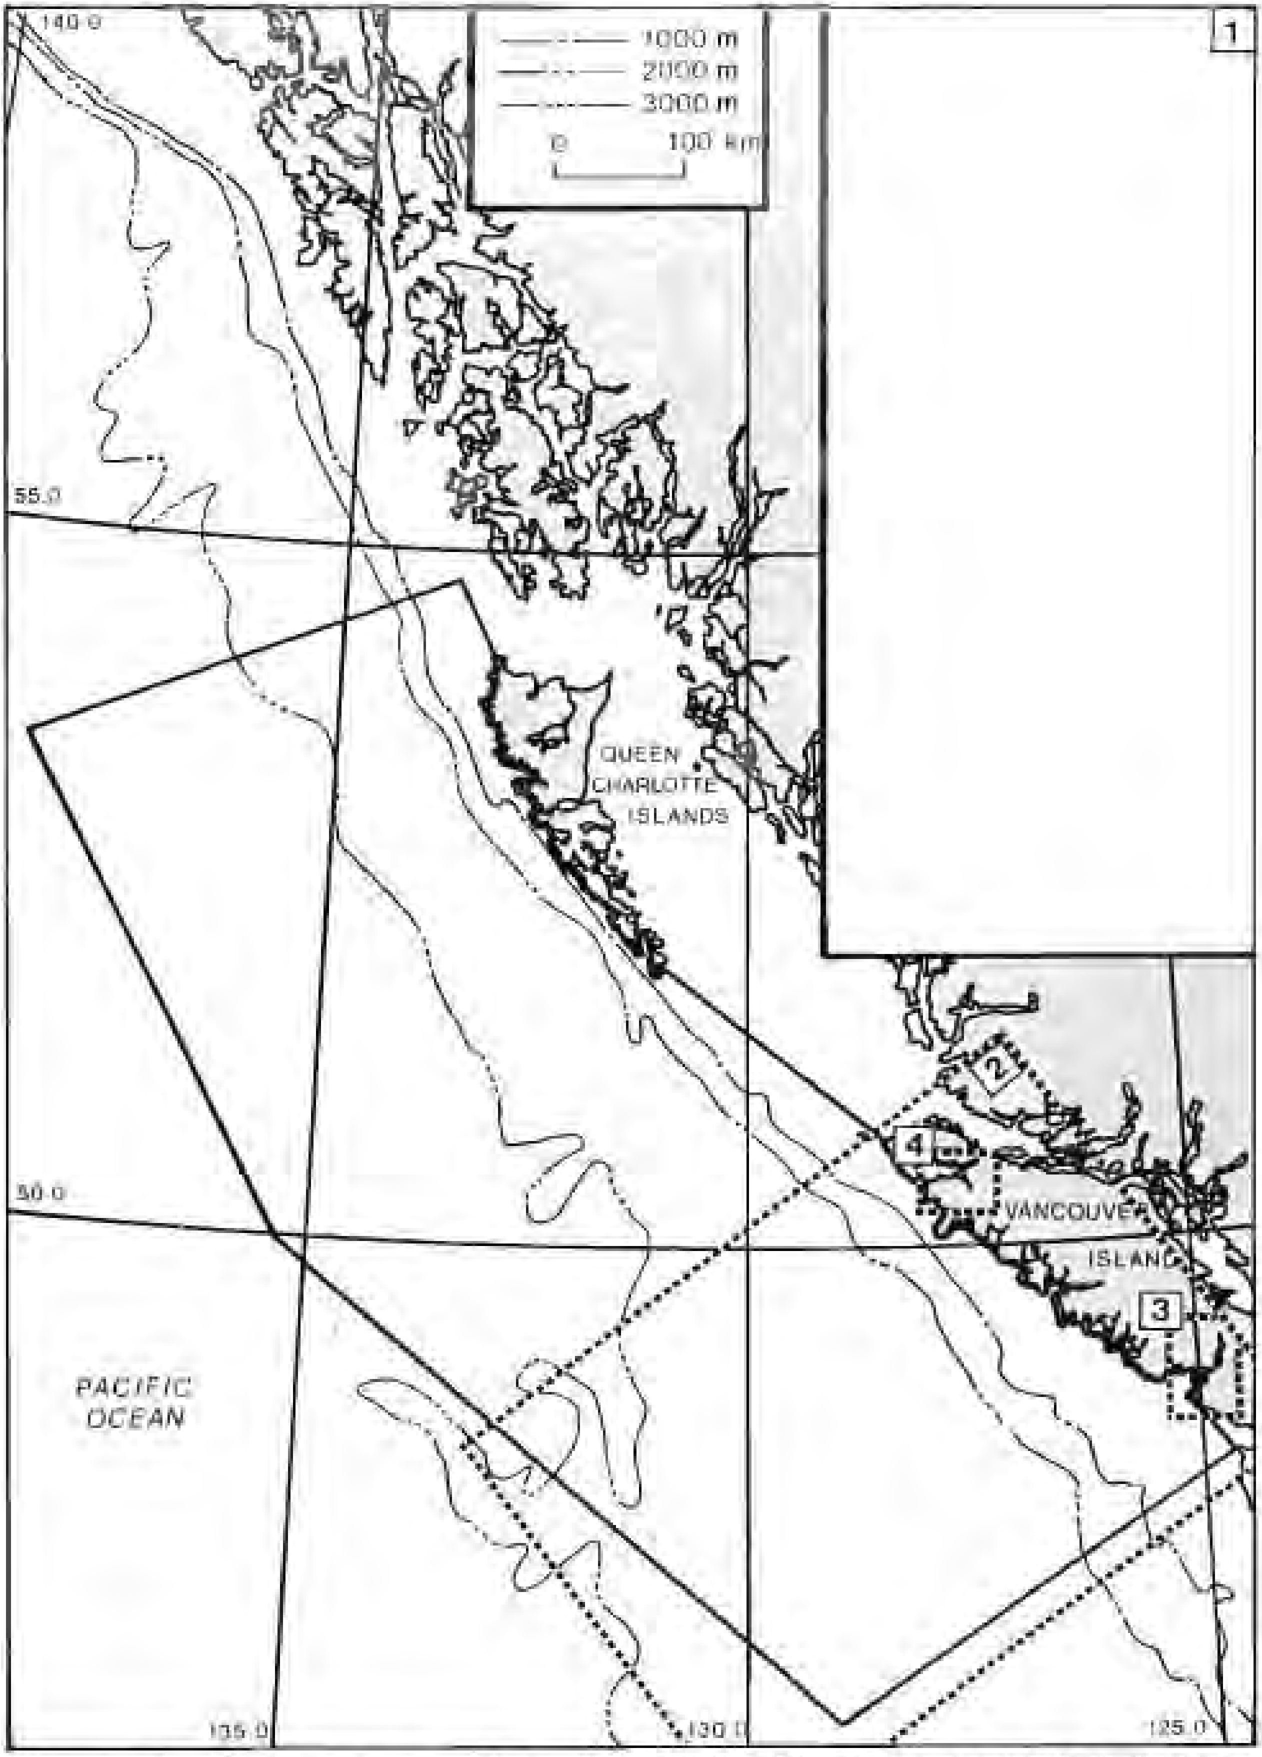

Figure 20: The four maps used to plot station locations are indicated above. All are Lambert Conformal Conic projection.
