Canadian Data Report Of Hydrography and Ocean Sciences

These reports provide a medium for the documentation and dissemination of data in a form directly useable by the scientific and engineering communities.

Generally, the reports will contain raw and/or analyzed data but will not contain interpretations of the data. Such compilations will commonly have been prepared in support of work related to the programs and interests of the Ocean Science and Surveys (OSS) sector of the Department of Fisheries and Oceans.

Data Reports are produced regionally but are numbered and indexed nationally. Requests for individual reports will be fulfilled by the issuing establishment listed on the front cover and title page. Out of stock reports will be supplied for a fee by commercial agents.

Regional and headquarters establishments of Ocean Science and Surveys ceased publication of their various report series as of December 1981. A complete listing of these publications and the last number issued under each title are published in the *Canadian Journal of Fisheries and Aquatic Sciences*, Volume 38: Index to Publications 1981. The current series began with Report Number 1 in January 1982.

Rapport statistique canadien sur l'hydrographie et les sciences océaniques

Ces rapports servent de véhicule pour la compilation et la diffusion des données sous une forme directement utilisable par les scientifiques et les techniciens.

En général, les rapports contiennent des données brutes ou analysées mais ne fournissent pas d'interprétations des données. Ces compilations sont préparées le plus souvent à l'appui de travaux reliés aux programmes et intérêts du service des Sciences et Levés océaniques (SLO) du ministère des Pêches et des Océans.

Les rapports statistiques sont produits à l'échelon régional mais sont numérotés et placés dans l'index à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page de titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

Les établissements des Sciences et Levés océaniques dans les régions et à l'administration centrale ont cessé de publier leurs diverses séries de rapports depuis décembre 1981. Vous trouverez dans l'index des publications du volume 38 du *Journal canadien des sciences halieutiques et aquatiques*, la liste de ces publications ainsi que le dernier numéro paru dans chaque catégorie. La nouvelle série a commencé avec la publication du Rapport n° 1 en janvier 1982.

PREFACE

These catalogues are produced by the Data Assessment Division at the Institute of Ocean Sciences. Joint government and industry contract projects have catalogued marine data sets their focus being primarily upon oceanography and fisheries. Data set quality appraisals are included to assist in establishing the usefulness of certain data for particular kinds of analyses and the confidence to be placed in interpretations. These appraisals will assist in setting priorities for incorporating the most useful data in the national Marine Environmental Data Service (MEDS) archives. Additional uses include research planning (especially for climatological studies), and the provision of the best available resume of marine data sources for environmental assessments.

The continuing emphasis on Arctic offshore development activity has emphasized the need to review the sufficiency and suitability of available scientific information for design, regulatory and planning purposes. This review has been divided into three phases: (1) compilation and appraisal of all existing data sets; (2) analysis of the suitability of the historical data for contributing to questions of particular interest; and (3) analysis and interpretation of data and estimation of the scientific confidence in answering particular questions. This report on the chemical oceanographic data of the Canada Basin - Arctic Ocean is a contribution to the first phase.

ABSTRACT

D.J. Thomas, R.W. Macdonald and M. Robinson. 1986. Arctic Data Compilation and Appraisal. Volume 18. Canada Basin - Arctic Ocean: Chemical Oceanography. 1926 through 1983.

Can. Data Rep. Hydrogr. Ocean Sci. 5: (Volume 18) 109 pp.

This volume is one of a group of catalogues designed to compile and appraise marine data sets for the Canadian Arctic. For ease of reference, the group has been organized with its subject matter divided into three disciplines: physics, chemistry and biology. The Arctic has been arbitrarily divided into seven geographical areas to include, where possible, major oceanographic regions. The format has been structured to facilitate comparison between subjects and regions. With such a large undertaking it is not possible to provide all reports at once. Therefore catalogues which are presently available in the series are indicated on the inside back cover of each volume.

Data collection is a continuing process and further updates of the catalogues are planned. Readers are invited to submit corrections and additions by writing the issuing establishment. These corrections will be incorporated in on-line computerized data set listings; they will be continuously available upon request.

SOMMAIRE

D.J. Thomas, R.W. Macdonald and M. Robinson. 1986. Arctic Data Compilation and Appraisal. Volume 18. Canada Basin - Arctic Ocean: Chemical Oceanography. 1926 through 1983.

Can. Data Rep. Hydrogr. Ocean Sci. 5: (Volume 18) 109 pp.

Le présent volume fait partie d'un groupe de catalogues destinés à compiler et à évaluer les séries de données marines sur l'Arctique canadien. Pour plus de commodité, la question traitée est structurée en trois grandes disciplines: physique, chimie et biologie. L'Arctique a été divisé arbitrairement en sept régions géographiques qui englobent autant que possible les grandes régions océanographiques. Les catalogues sont présentés de façon à faciliter la comparaison entre les sujets et les régions. Le domaine est si vaste qu'il est impossible de fournir tous les catalogues en une seule fois. Les catalogues de la série actuellement disponibles sont indiqués à la fin de chaque volume à l'intérieur de la couverture.

La collecte des données est un processus permanent et il est prévu de mettre à jour les catalogues par la suite. Les lecteurs sont invités à soumettre par écrit les corrections et les additions à l'établissement auteur. Ces corrections seront traitées en direct sur ordinateur et incorporées aux listes qui pourront être obtenus sur demande.

VOLUME 18

CANADA BASIN: CHEMICAL OCEANOGRAPHY

THIS PAGE IS BLANK

Volume 18: Canada Basin - Arctic Ocean: Chemical Oceanography.

VOLUME ABSTRACT

This inventory contains a catalogue of 134 chemical oceanographic data sets from offshore waters of Canada Basin - Arctic Ocean during the period 1926 - 1983. The inventory includes commonly-measured substances such as dissolved oxygen, major and minor elemental components, nutrients and less frequently measured substances such as trace elements, hydrocarbons and chlorinated hydrocarbons. Suspended particulate matter (although not a truly chemical quantity) is also included. Data sets are included for sea ice, sea water, sediments and biota. A geographical index and alphabetical references (by data set number) are also included. Unlike other catalogues of this series, only Table 1 (general details of the sampling excursions) is presented here. Data set maps, measurement details and ratings, and station locations were not prepared; it is our plan to do so in the future.

Key Words: Canada Basin, Arctic Ocean, chemical oceanography, data sets, inventory, dissolved oxygen, nutrients, heavy metals, hydrocarbons, chlorinated hydrocarbons, suspended particulate material, sediments, biota.

1. INTRODUCTION

This inventory comprises 134 data sets of chemical oceanographic data collected in the Canada Basin - Arctic Ocean during the period 1926 - 1983. The quantity and type of data are distributed irregularly over this time period with the bulk of the data collection occurring after 1960 as shown in Figure 1.

Figure 1 Yearly distribution of chemical oceanographic data sets for the Canada Basin - Arctic Ocean.

The objective of this inventory was to compile all available chemical oceanographic data sets from the Canada Basin - Arctic Ocean waters located within Map Area 2 (Figure 2A) into a single data bank. Place names are indicated in Figures 2B and 2C. No attempt was made to appraise the quality of the data or to map the station locations as in earlier inventories (e.g., Thomas et al. 1986). This task will be addressed in the future.

The inventory is ongoing. As new data and previously inaccessible data become available, they will be added to a computerized data base maintained at the Institute of Ocean Sciences, Sidney, B.C. Information about new data sets, older data sets which do not appear in this inventory or errors in this inventory, should be submitted in writing to the Institute of Ocean Sciences.

Wherever possible, formats in this inventory are consistent with those used in the Arctic Data Compilation and Appraisal Series (IOS, 1985).

1.1 The Study Area

The surface area of the Canada Basin Study Area (Figure 2A) is immense, about two million square kilometres, or roughly the size of British Columbia, Alberta and Saskatchewan combined. Included are the portions of the Arctic Ocean between 28 and 180°W longitude, as well as the bordering continental slopes and shelves of northern Greenland, the Canadian archipelago and Alaska.

The major bathymetric feature is the Canada Basin, which comprises almost half the study area and has depths exceeding 3000 m. North of the Canada Basin are three submarine ridges, the Alpha, Mendeleev and Lomonosov ridges. The latter rises to depths as shallow as 1300 m. The Makarov Basin lies between the Lomonosov and Mendeleev ridges, and is separated from the Canada Basin by a sill of between 2000 and 2500 m depth. West of the Canada Basin lies the Chukchi Shelf and the Northwind Ridge/Chukchi Plateau extension. The study area also includes the Alaskan Beaufort Sea slope and shelf, as well as the coastal waters off the Queen Elizabeth Islands and northern Greenland.

Although the study area is immense, the amount of oceanographic data collected to the present has been limited by the harsh climate and the sea-ice which covers much of the area. Open water is confined largely to the coastal regions and to the summer period. The breadth of open water at the coast can vary from negligible to a few hundred kilometres offshore, depending on wind and melt conditions.

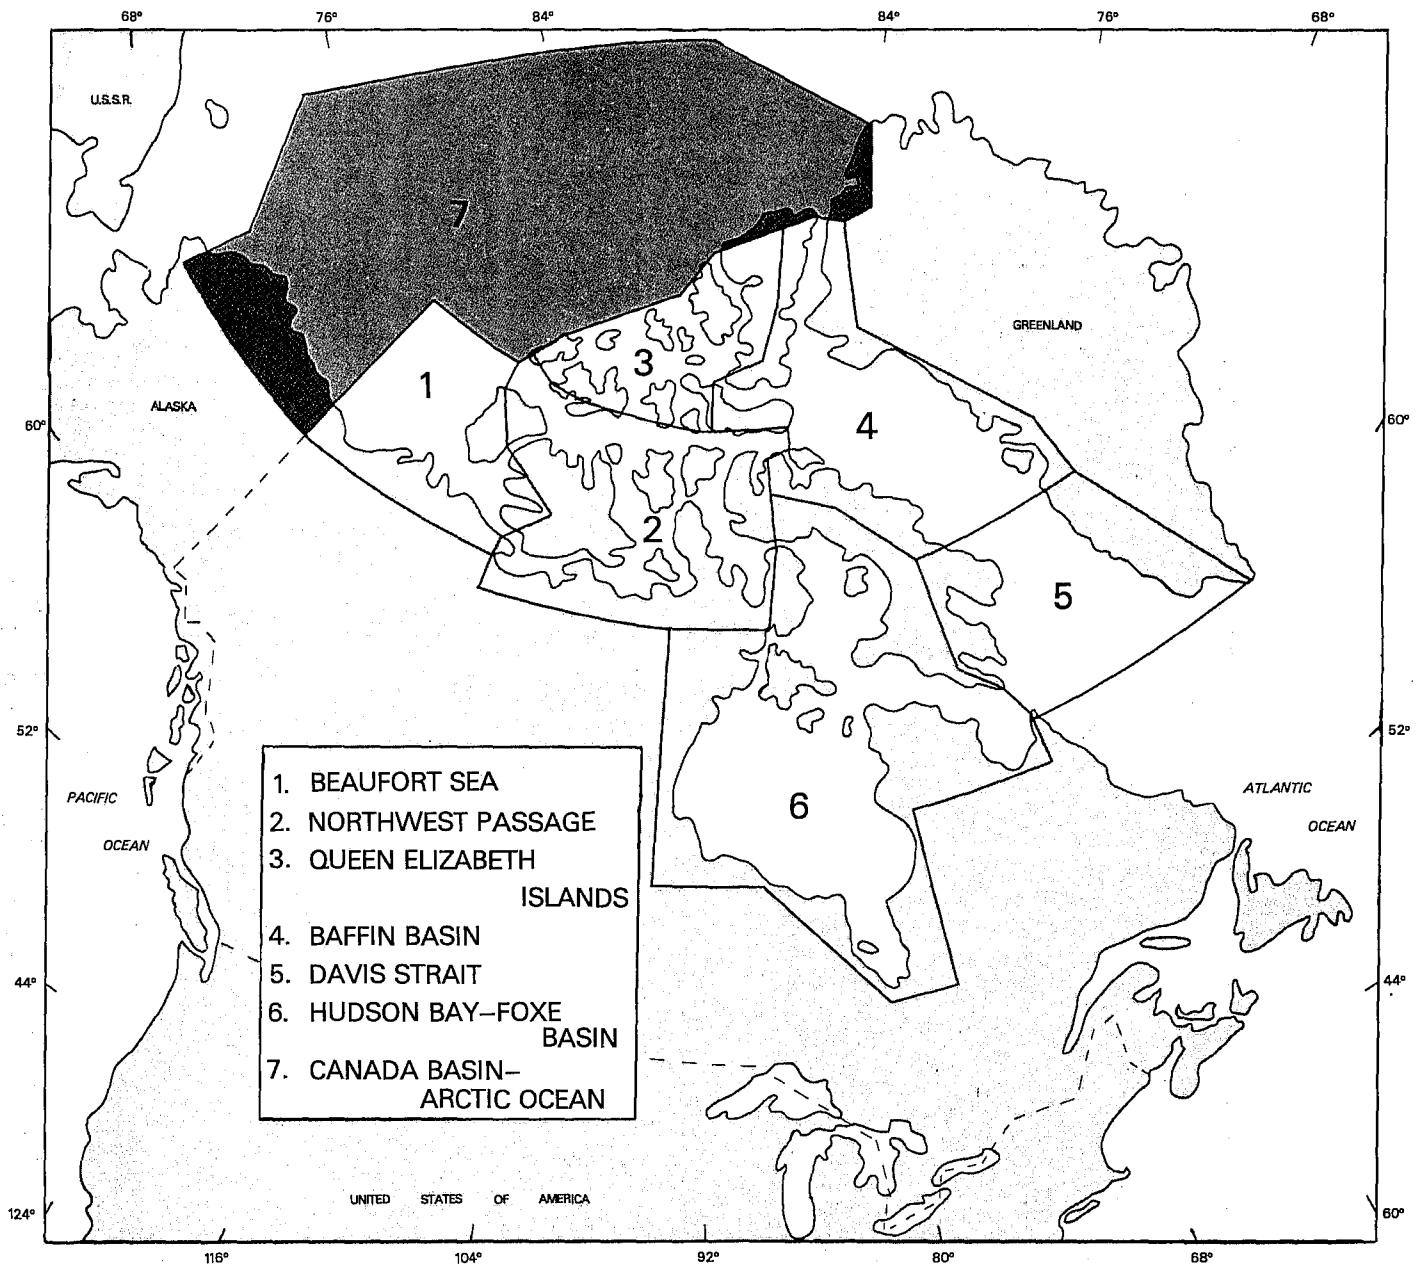

Figure 2A. The area (7) covered by this volume is shaded on the map above.

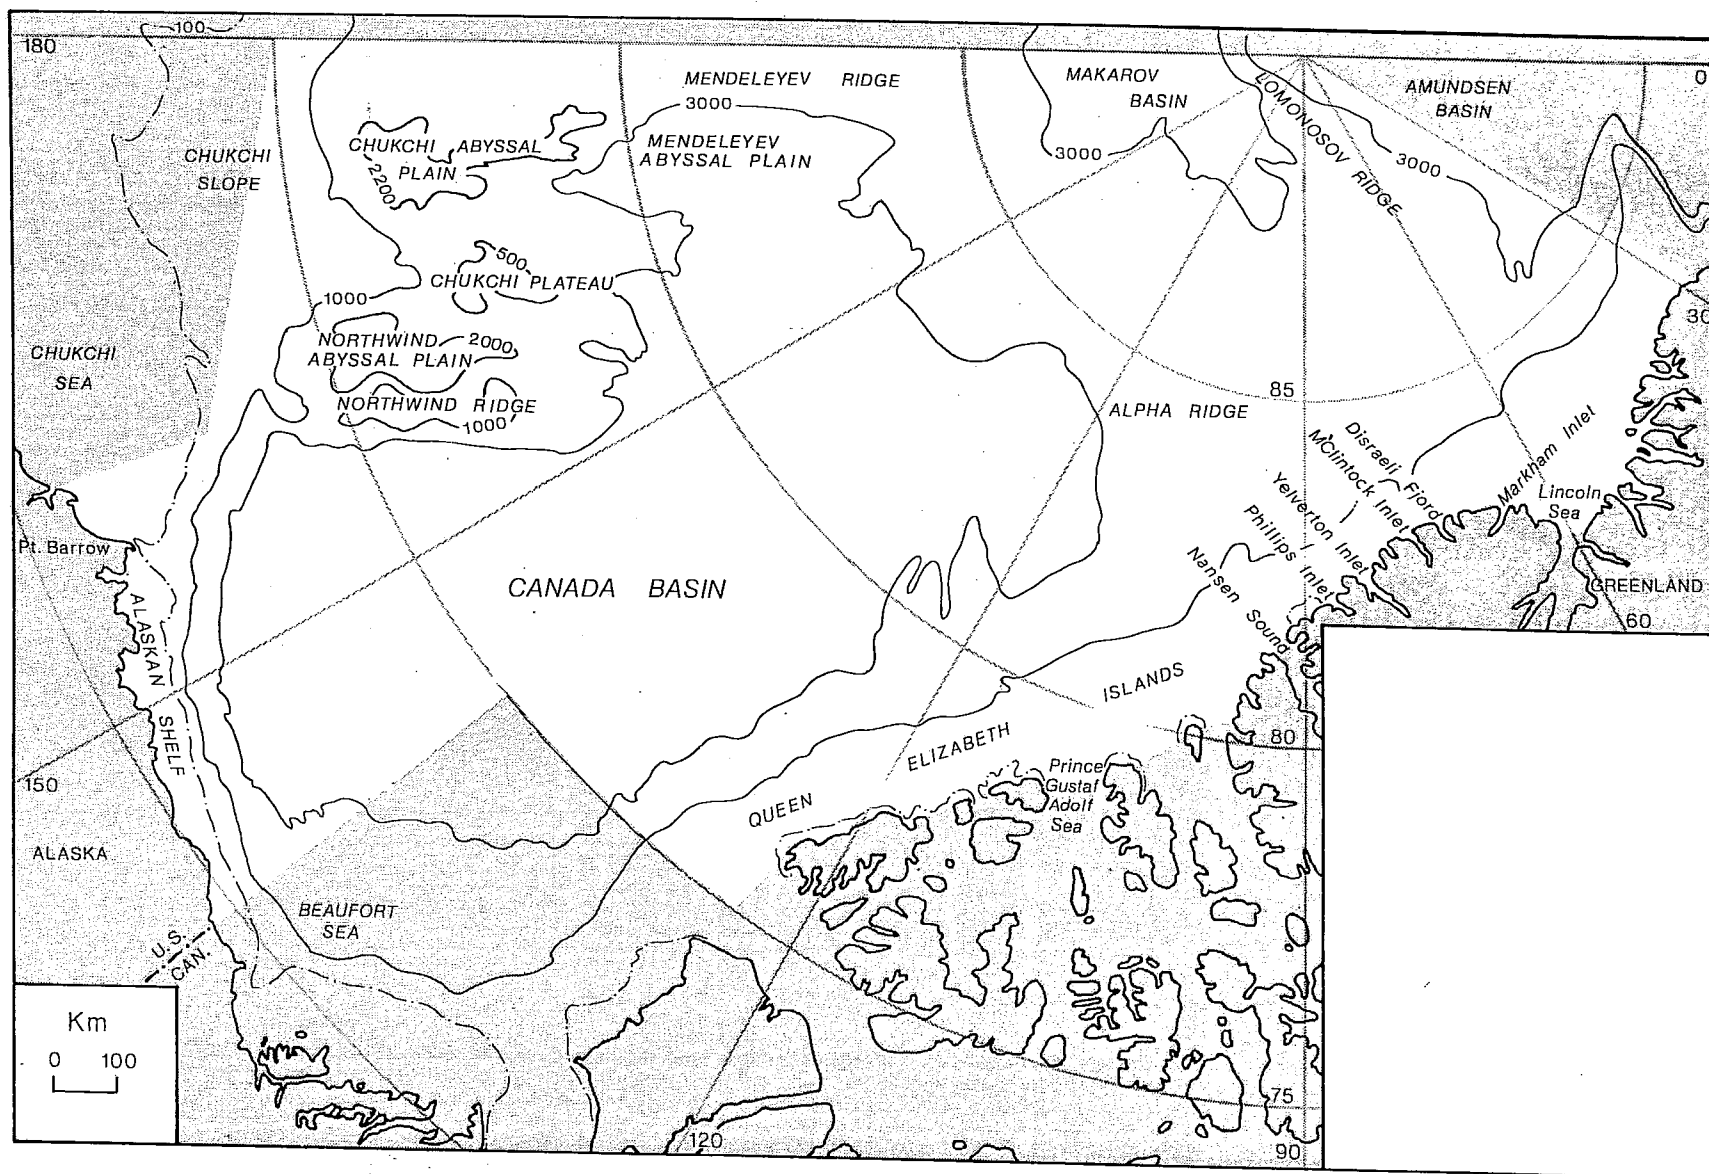

Figure 2B. Place names in the Canada Basin study area. Depth contours are in metres.

Figure 2C. Place names for the Alaskan coastal area.
Depth contours are in metres.

Because of the ice coverage, data over most of the area have been obtained by landing aircraft on the ice, and from drifting ice stations. Only in the Alaskan coastal regions have surface vessels been effective in the collection of oceanographic data.

2. CHEMICAL DATA PRESENTATION: Types of Data

All chemical data have been grouped according to the environmental medium or compartment in which they are found, as follows:

Medium	Constituents Included
Sea Ice	- dissolved or occluded
Water Column (Sea Water)	- dissolved constituents - particulate constituents
Sediments	- surficial sediments - sediment cores (interval sampling) - interstitial pore waters
Biota (flora and fauna)	- seawater-dwelling organisms - bottom sediment dwelling organisms - marine mammals - marine birds

The inventory includes all available data of a "chemical nature". This includes commonly-measured substances such as dissolved oxygen, major and minor elemental components, nutrients and less frequently measured substances such as trace elements, hydrocarbons and chlorinated hydrocarbons. Turbidity and suspended particulate material are not truly chemical quantities in the classical sense, but are included in the inventory because they are important factors in the interpretation of chemical data and because they are more logically included with the chemical inventory rather than the physical or biological inventories.

The largest amount and most diverse data are found for water column constituents. Field-based analyses of samples at the time of collection have been rare because most chemical analyses require specialized or sophisticated equipment. Water samples have been frequently processed in the field to the stage where sample preservation is convenient and then returned to the laboratory for analysis. Samples for dissolved oxygen and pH analysis, on the other hand, have been routinely analysed in the field shortly after collection. Other determinations which can and have been

made in the field include the reactive nutrients although these have also been preserved and returned to the laboratory. Measurements have been made rarely in situ, and then only for dissolved oxygen.

The other types of samples: biota and sediments have been obtained in decreasing quantities respectively and all have been analysed exclusively in the laboratory after preservation for some extended period of time. A summary of the chemical data types included in the inventory is shown in Table I.

zinc oxide			1	
zirconium			1	

3. OUTLINE OF DATA INVENTORY ORGANIZATION

3.1 Outline of Table 1 Organization

The data are organized into a chronological series of data sets beginning with the year 1926. No chemical data collected before 1926 could be found. Each data set comprises sampling or chemical measurements taken during a single cruise, or during a sampling excursion usually by a single agency. It is assumed, then, that data within a given data set have been collected uniformly and should be internally consistent insofar as sampling methodology is concerned.

Each data set has been assigned an identification number of the form yy-nnnn, where yy = last 2 digits of the year in which data were collected and nnnn = order of identification for that particular data set for that year. The data set number is a unique identifier which applies throughout this series of inventories; for example, any data set identified as 72-0009 is the same no matter where the reference to it is made. In certain cases, data may have been collected over a period of months or years by a common study team with minor or major differences occurring in the types of data collected at each sampling period. When this occurred, letters were used as a suffix to the data set number to distinguish the various sample collections. For example, data set 70-0021 is divided into three parts in the inventory - 70-0021A, 70-0021B and 70-0021C. While there is insufficient reason to regard the three as separate data sets, the subdivision is made to emphasize that different parameters were sampled during the various sampling periods. Gaps may appear in the sequence of data set numbers in this inventory for a particular year, because each data set will not appear in every discipline and geographical area.

3.2 Description of Table 1 Headings

Table 1 provides general details of sampling excursions and includes:

- (1) identification of the specific region within the study area where sampling was conducted;
- (2) the period of time during which the measurements were made;
- (3) the ship or agency which collected the data;

- (4) a listing of the chemical quantities measured or sampled during the collection period, with those quantities for which data are published and available for inclusion in this inventory in bold type. All entries are not in bold type because:
 - (a) all samples collected on original cruises may not have been analysed;
 - (b) samples may have been analysed but results may not be available in the public domain or may be untraceable;
 - (c) samples may be lost or destroyed.
- (5) concurrent physical and biological measurements or samples.
