Canadian Data Report Of Hydrography and Ocean Sciences

These reports provide a medium for the documentation and dissemination of data in a form directly useable by the scientific and engineering communities.

Generally, the reports will contain raw and/or analyzed data but will not contain interpretations of the data. Such compilations will commonly have been prepared in support of work related to the programs and interests of the Ocean Science and Surveys (OSS) sector of the Department of Fisheries and Oceans.

Data Reports are produced regionally but are numbered and indexed nationally. Requests for individual reports will be fulfilled by the issuing establishment listed on the front cover and title page. Out of stock reports will be supplied for a fee by commercial agents.

Regional and headquarters establishments of Ocean Science and Surveys ceased publication of their various report series as of December 1981. A complete listing of these publications and the last number issued under each title are published in the *Canadian Journal of Fisheries and Aquatic Sciences*, Volume 38: Index to Publications 1981. The current series began with Report Number 1 in January 1982.

Rapport statistique canadien sur l'hydrographie et les sciences océaniques

Ces rapports servent de véhicule pour la compilation et la diffusion des données sous une forme directement utilisable par les scientifiques et les techniciens.

En général, les rapports contiennent des données brutes ou analysées mais ne fournissent pas d'interprétations des données. Ces compilations sont préparées le plus souvent à l'appui de travaux reliés aux programmes et intérêts du service des Sciences et Levés océaniques (SLO) du ministère des Pêches et des Océans.

Les rapports statistiques sont produits à l'échelon régional mais sont numérotés et placés dans l'index à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page de titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

Les établissements des Sciences et Levés océaniques dans les régions et à l'administration centrale ont cessé de publier leurs diverses séries de rapports depuis décembre 1981. Vous trouverez dans l'index des publications du volume 38 du *Journal canadien des sciences halieutiques et aquatiques*, la liste de ces publications ainsi que le dernier numéro paru dans chaque catégorie. La nouvelle série a commencé avec la publication du Rapport n° 1 en janvier 1982.

ABSTRACT

Dobson, D. and Petrie, B. 1982. Long-term temperature monitoring program 1981. Can. Data Rep. Hydrogr. Ocean Sci. 6: vii + 297 p.

Temperature data collected in 1981 near the bottom at sites of productive invertebrate fisheries are presented.

RÉSUMÉ

Dobson, D. and Petrie, B. 1982. Long-term temperature monitoring program 1981. Can. Data Rep. Hydrogr. Ocean Sci. 6: vii + 297 p.

On présente les données relatives à la température recueillies, en 1981, à proximité du fond aux endroits où la pêche des invertébrés est productive.

1. INTRODUCTION

A pilot program to obtain continuous long term measurements of bottom temperature was initiated in March 1978, primarily at the request of biologists from the St. Andrews Biological Station. Their studies indicate that water temperature has a significant influence on the growth and feeding activity of commercial invertebrates (lobster, crab and scallops). The results of the first year's observations were reported by Gregory and Dobson (Data Series/BI-D-78/September 1978.)

We present the data gathered during the 1981 field season from the Gulf of Maine - Bay of Fundy, Scotian Shelf, Gulf of St. Lawrence and Newfoundland Shelf. Data collection includes input from several sources. Biologists from Nova Scotia and Newfoundland use BIO instruments, rotated and serviced periodically. St. Andrews group maintain their own instruments; their data are marked with an asterisk in this report.

2. INSTRUMENTATION

The Ryan Model J thermograph has been used in the program and is described by Gregory and Dobson. The deployment of the moorings is handled by local fishermen. The basic mooring configuration is shown in Figure 1. Modifications by various users have generally been to make the mooring less attractive to those who consider the components worth stealing. Newfoundland sites are diver serviced in relatively sheltered areas.

3. MOORING SITES, DATA RETURN AND PROCESSING

The mooring sites have been divided into three areas: 1) Scotia-Fundy, 2) Gulf, 3) Newfoundland. Tables for the mooring locations, with corresponding area maps, begin on page 5. Site names, instrument serial numbers, depths, co-

ordinates, data length and location are recorded in the tables. A zero indicates that information is unavailable for a particular quantity. Instrument loss or failure is shown in the same format using start-stop time space for remarks.

All data reduction, plotting and calculations were contracted out to Evans Computer Applications Ltd. The analogue charts were digitized every 4 hours to the nearest 0.5°C and calculations are based on these data. The calculations included daily mean temperatures and the accumulated degree days (ADD) starting with the beginning of the record. Reference temperatures ($T(\text{ref})$) of 0°C and 4°C were used. The first and last calculations generally include partial days depending on the time the moorings were set and recovered.

We have: $\text{ADD} = (T - T(\text{ref})) * \text{time}$ where for $T < T(\text{ref})$, $\text{ADD} = 0$ and time is given in days. Table 5 gives a summary of the data return and some of the problems encountered during the field season. Table 6 gives monthly mean sea surface temperatures for three 1° X 1° squares in the southwest Nova Scotia area. Table 7 gives the monthly degree calculations relative to 0°C (dividing by the number of days in a month will give the approximate average monthly temperature).

Instrument recoveries do not always coincide with the calendar year, as in the case of instruments presumed lost and later recovered. Thus, reported in any year's atlas is all the data recovered during that year.

4. DISCUSSION

The short records obtained at 12 and 20 m at Alma in the Bay of Fundy were identical to within instrumental accuracy. Successive sensors (61029 and 61448) at Port Maitland Fairway differ by about 0.75°C which again is within the stated +0.5°C accuracy of the instruments. The last report (Dobson et al., Long

Term Temperature Monitoring Program 1980, Bedford Institute of Oceanography Data Series/BI-D-81-3/April 1981) indicated that sea surface temperature observations (Table 6, Gulfstream, now Oceanographic Monthly Summary) showed reasonable agreement with monthly average temperatures for several coastal sites in the Southwest Nova Scotia area. Thus surface temperature measurements could serve as proxy data in the absence of bottom observations. However, observations at Lurcher Shoal, the site farthest offshore, differ from monthly average sea surface temperature by as much as 3°C.

Data from School Point, Lobster Bay and Port Maitland Fairway, separated by 140 km, were identical for January and February. Fluctuations of temperature at Lockeport and Port LaTour were highly coherent and in phase for the period July-October. Temperature at Port LaTour was higher by about 1°C than at Lockeport. Variability at Lockeport was similar to that at Cape Sable but with a lag of 1 to 3 days. If this were due solely to advection, the lags imply along shelf velocities of 0.24 to 0.71 m/s. The latter value is probably too high. Fluctuations at Cape Sable were also evident some time later at Gannet Rock (implying a rate of 0.20 m/s) and Port Maitland (implying a rate of 0.07 m/s). These observations are similar to ones made in the past and are compatible with the general circulation of the area. The observations at two depths (11, 22 m) at Gannet Rock were the same.

In Northumberland Strait the records from Cape Egmont, Bayfield, Toney River, Georges Bay, Skinners Cove and Pugwash were quite similar. As in 1980, temperature at Victoria was significantly lower than at Cape Egmont. Observations at Richibucto were at times 5°C less than at Cape Egmont. The vertical array of recorders at North lake features temperatures at 5 m greater than those at 10 m by 1 to 2°C on average with differences of up to 5°C for periods of several days. Variability appears to be greatest at 20 m and is in phase with

the fluctuations at shallower depths.

The -3°C readings from Shag Island, Magdalen Islands indicate that the sensors are reading low. This was confirmed on subsequent calibrations. The observations at Havre-aux-Maisons exhibit a diurnal cycle with maximum temperature in the early afternoon (thus related to the sun cycle rather than a diurnal tidal constituent). During times of overlap, the data from Shag Island at 12 and 20 m are identical.

The two sensors located in Spencer's Cove, Newfoundland give essentially the same record for the period November, 1980 to January, 1982.
