## Canadian Data Report Of Hydrography and Ocean Sciences

Data reports provide a medium for the documentation and dissemination of data in a form directly useable by the scientific and engineering communities. Generally, the reports contain raw and / or analyzed data but will not contain interpretations of the data. Such compilations commonly will have been prepared in support of work related to the programs and interests of the Ocean Science and Surveys (OSS) sector of the Department of Fisheries and Oceans.

Data reports are not intended for general distribution and the contents must not be referred to in other publications without prior written authorization from the issuing establishment. The correct citation appears above the abstract of each report. Data reports are abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out of stock reports will be supplied for a fee by commercial agents.

Regional and headquarters establishments of Ocean Science and Surveys ceased publication of their various report series as of December 1981. A complete listing of these publications is published in the *Canadian Journal of Fisheries and Aquatic Sciences*, Volume 39: Index to Publications 1982. The current series, which begins with report number 1, was initiated in January 1982.

## Rapport statistique canadien sur l'hydrographie et les sciences océaniques

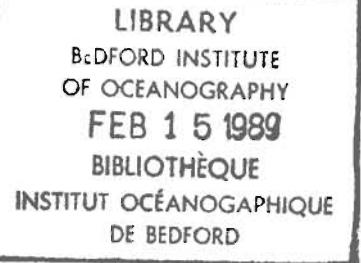

Les rapports statistiques servent de véhicule pour la compilation et la diffusion des données sous une forme directement utilisable par les scientifiques et les techniciens. En général, les rapports contiennent des données brutes ou analysées, mais ne fournissent pas d'interprétation des données. Ces compilations sont préparées le plus souvent à l'appui de travaux liés aux programmes et intérêts du service des Sciences et levés océaniques (SLO) du ministère des Pêches et des Océans.

Les rapports statistiques ne sont pas destinés à une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans une autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports statistiques sont résumés dans la revue *Résumés des sciences halieutiques et aquatiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés sont fournis contre rétribution par des agents commerciaux.

Les établissements des Sciences et levés océaniques dans les régions et à l'administration centrale ont cessé de publier leurs diverses séries de rapports en décembre 1981. Une liste complète de ces publications figure dans le volume 39, Index des publications 1982, du *Journal canadien des sciences halieutiques et aquatiques*. La série actuelle a commencé avec la publication du rapport numéro 1 en janvier 1982.

ABSTRACT

deYoung, B. and Tang, C.L. 1988. Current meter, CTD and meteorological observations on the northern Grand Banks (47°N, 48°W) for April-October 1986. Can. Data Rep. Hydrogr. Ocean Sci. No. 63: iv + 94 pp.

Data are presented from three current meter and thermistor chain moorings deployed on the northern Grand Banks near 47°N, 48°W. Approximately 174 days of data were collected from April to October 1986. In support of this mooring program, two cruises were conducted in the area: 15-28 April and 8-21 October. Batfish, CTD and Doppler current profiler data were collected on each cruise. Both cruise and mooring data are presented in this report. Meteorological data from a nearby oil rig are also presented.

RÉSUMÉ

deYoung, B. and Tang, C.L. 1988. Current meter, CTD and meteorological observations on the northern Grand Banks (47°N, 48°W) for April-October 1986. Can. Data Rep. Hydrogr. Ocean Sci. No. 63: iv + 94 pp.

Des données sont présentées provenant de trois mouillages de moulinet hydrométrique et chaîne de thermistance déployés sur la partie nord des Grands Bancs près de 47°N, 48°O. Environ 174 jours de données furent recueillis d'avril à octobre 1986. À l'appui du programme de mouillage, deux croisières furent effectuées dans la région: 15-28 avril et 8-21 octobre. Des données de Batfish, conductivité-température-profondeur et profileur de courant Doppler furent recueillies durant chaque croisière. Les données de croisière et de mouillage sont présentées dans ce rapport. Des données météorologiques provenant d'une plateforme pétrolière sont aussi présentées.

## Introduction

The data presented in this report were collected as part of a study of current variability and mixed-layer dynamics on the Grand Banks. Some of the data presentation, complex demodulation for instance, reflects the research focus of this project. There were two cruises to the northern Grand Banks in 1986: the first (15-28 April) to deploy the moorings and collect CTD data on the spring conditions; the second cruise (8-21 October) was used to recover the moorings and collect data representing fall conditions. Several different types of data were collected on each cruise: Batfish, CTD and Doppler current profiles. All of the data underwent quality control in an attempt to remove bad values.

The presentation of data in this report is divided into two sections. In the first, current meter and thermistor chain data as well as some of the meteorological data collected at a nearby oil rig (see Fig. 1) are presented mostly as time series plots. In the second section, data from the two cruises are presented. With the exception of the Doppler current profiles, most of these data are temperature, salinity and density measurements.

## Description of Time Series Data

The locations of the moorings deployed in this study are shown in Fig. 1. The positions and times of the mooring instrumentation are given in Table 1. Nine Aanderaa current meters plus one Vector Averaging Current Meter (VACM) sampling every 30 minutes were deployed on the three moorings. Nearly all of the data were recovered except those from two of the Aanderaa current meters, the bottom instruments at 781 and 782. Four Aanderaa thermistor chains (one hour sampling) were also deployed, two on one mooring (781) and one on each of the other two moorings. Double legged moorings were used, all set in about 90 m of water. Only one leg of each mooring, with a subsurface float at about 30 m depth, two of the Aanderaa current meters were placed, nominally at 30 and 60 m depth. On the other leg of the mooring, connected to the first by a groundline, the surface float was placed just above the upper current meter, nominally at 20 m depth. On one of the moorings a

VACM was placed two meters above the uppermost Aanderaa current meters which had paddle wheel rotors. All of the other Aanderaa current meters used Savonius rotors. Estimated errors for the Aanderaa current meter and thermistor chain data are given in Table 2.

Some meteorological data were collected at an oil rig platform located near the mooring site (Fig. 1). These data were obtained from the Atmospheric Environment Service who performed most of the quality control on the data.

Figures 2-4 present sample time series of temperature, salinity and velocity from three different depths on mooring 783. A kinetic energy spectrum at 34 m at station 783 is shown in Fig. 5. A rotary autospectral at 24 and 64 m is presented in Fig. 6. Inner and outer spectra between these time series are presented in Fig. 7 and 8. Time series of low frequency temperature, salinity and velocity components are presented in Fig. 9-17. These time series were obtained by application of a low-pass  $\sin x/x$  filter with a 32 hour cutoff. Progressive vector diagrams of the raw current meter data are shown in Fig. 18-25. Some information about the statistics of the current data are presented in Table 3. Monthly means and standard deviations are presented. The results of harmonic analysis of the current meter data are presented in Table 4. Complex demodulation was carried out on selected current meter records (Fig. 26-31). The local inertial period (16.2 hours) was used as the demodulation period. A low pass filter was then applied to yield the amplitude and phase of each component of the inertial signal which are plotted in Fig. 26-31. Time series of temperature from different depths at the three moorings, measured by thermistor chain, are presented in Fig. 32-43. Daily averaged temperatures at selected depths are plotted in Fig 44-46. More detailed plots of daily averaged temperature and temperature gradient profiles are presented in Fig. 47 and 48. Meteorological data (3-hour sampling) from a nearby oil rig (see Fig. 1) are plotted in Fig. 49 and 50. In Fig. 51, a 12.5 hour average of currents on day 285, as measured by the Doppler current profiler (ADCP) on CSS DAWSON at the CTD anchor station at 46°53'N, 48°44'W (see Fig 61-72 for CTD data).

### Description of density data

Temperature and salinity data, from which density was computed, were collected with a towed depth-cycling CTD system (Batfish) and a vertically profiling CTD attached to a rosette water sampler. A Guildline digital CTD system (Model 8705) was used in both cases. Calibration of the CTD was checked by a salinity measurement of water samples obtained using the rosette. After translation of the CTD data, spikes were removed from the data. The estimated errors in the processed CTD data are  $T \pm 0.01^\circ\text{C}$ ,  $S \pm 0.01$  and  $\sigma_t \pm 0.01$ .

The Batfish tow lines conducted on the spring cruise (15-28 April 1986) are shown in Fig. 52. Not all of the data from this cruise, nor from the fall cruise, will be presented. A representative cross-shelf transect from each cruise will be plotted. Contours of temperature, salinity and  $\sigma_t$  are presented in Fig 53. CTD profiles from the spring cruise are shown in Fig. 54-56. The positions and times of these stations are given in Table 5.

Station positions for the fall Batfish section are shown in Fig. 57. The location of CTD stations from the fall cruise are shown in Fig. 58. Contours of temperature, salinity and  $\sigma_t$  for the Batfish section are shown in Fig. 59. CTD plots are presented in Fig. 60-75. The positions and times of these stations are given in Table 6.

Table 1. Current meter and thermistor chain mooring information for 1986 deployments. Partial records are indicated by brackets. Approximate times of complete records are indicated in the last two columns.
