Canadian Data Report Of Hydrography and Ocean Sciences

These reports provide a medium for the documentation and dissemination of data in a form directly useable by the scientific and engineering communities.

Generally, the reports will contain raw and/or analyzed data but will not contain interpretations of the data. Such compilations will commonly have been prepared in support of work related to the programs and interests of the Ocean Science and Surveys (OSS) sector of the Department of Fisheries and Oceans.

Data Reports are produced regionally but are numbered and indexed nationally. Requests for individual reports will be fulfilled by the issuing establishment listed on the front cover and title page. Out of stock reports will be supplied for a fee by commercial agents.

Regional and headquarters establishments of Ocean Science and Surveys ceased publication of their various report series as of December 1981. A complete listing of these publications and the last number issued under each title are published in the *Canadian Journal of Fisheries and Aquatic Sciences*, Volume 38: Index to Publications 1981. The current series began with Report Number 1 in January 1982.

Rapport statistique canadien sur l'hydrographie et les sciences océaniques

Ces rapports servent de véhicule pour la compilation et la diffusion des données sous une forme directement utilisable par les scientifiques et les techniciens.

En général, les rapports contiennent des données brutes ou analysées mais ne fournissent pas d'interprétations des données. Ces compilations sont préparées le plus souvent à l'appui de travaux reliés aux programmes et intérêts du service des Sciences et Levés océaniques (SLO) du ministère des Pêches et des Océans.

Les rapports statistiques sont produits à l'échelon régional mais sont numérotés et placés dans l'index à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page de titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

Les établissements des Sciences et Levés océaniques dans les régions et à l'administration centrale ont cessé de publier leurs diverses séries de rapports depuis décembre 1981. Vous trouverez dans l'index des publications du volume 38 du *Journal canadien des sciences halieutiques et aquatiques*, la liste de ces publications ainsi que le dernier numéro paru dans chaque catégorie. La nouvelle série a commencé avec la publication du Rapport n° 1 en janvier 1982.

ABSTRACT

Forbes, J.R., K.L. Denman, D.L. Mackas and R.M. Brown. 1988. Ocean Ecology data report: subarctic Pacific Ocean, May 1984 (Project SUPER). Can. Data Rep. Hydrogr. Ocean Sci. 64: 147 p.

The results of a sampling program during May 1984 in the vicinity of Ocean Station P in the subarctic Pacific are presented. Data reported include physical, chemical and biological observations from bottle samples collected with an integrated vertical profiler, and zooplankton counts from samples collected by a Bioness multiple net system. These data were collected as part of the Canadian contribution to the Subarctic Pacific Ecosystem Research project.

Key words: data, oceanographic, Pacific Ocean

RÉSUMÉ

ACKNOWLEDGEMENTS

We appreciate the assistance at sea of R. Bigham, G. Chase, A. Gargett, S. Hill, K. de Macedo, M. Orellana, M.J. Perry and H. Sefton. Personnel of the CSS Parizeau provided excellent support to our field program. We thank R. Waters for the enumeration of phytoplankton samples, A. Nemec for software production and support, S. Buckingham for manuscript production, and R. Brinkhurst for reviewing the manuscript. As usual, S. Thomson provided expert editorial services.

INTRODUCTION

The Ocean Ecology group at the Institute of Ocean Sciences carried out a research cruise (OE 84-02) to Ocean Station P (50°N, 145°W) from 7 May to 25 May 1984. This cruise was a cooperative operation with the U.S. ship RV Wecoma as part of the Subarctic Pacific Ecosystem Research project (SUPER). The major objectives of the cruise were twofold. The first was to test hypotheses related to the control of phytoplankton production and biomass in the subarctic Pacific. The second was to investigate variability of biological, physical and chemical parameters over moderate length scales of the order of 50 km. On the return leg from Station P to the Strait of Juan de Fuca, CTD casts were performed, as part of the continuing set of time series observations along Line P. Physical, chemical and biological data were collected with an integrated oceanographic vertical profiler (OVP) consisting of several electronic sensors, a data acquisition system (DAS), and a remotely triggerable array of Niskin bottles (rosette sampler). In this report we present an inventory of all stations with a record of bottle samples that were collected at each station, the results of the analysis of bottle samples, and selected data from the electronic sensors. Species counts from phytoplankton samples collected by bottle and zooplankton counts collected by Bioness multiple net system are also included.

Additional data were collected on this cruise, but are not presented here. Denman and Gargett (1988) analyzed data from a drogued drifting buoy with a thermister chain and anemometer deployed near Station P from 12 May to 20 May 1984, a continuous record of above surface instantaneous photosynthetically active irradiance (PAR), and vertical microstructure profiles acquired with a free-fall profiler (FLY). Data from continuous underway mapping of temperature, conductivity, phytoplankton fluorescence, and zooplankton-sized particles on grid surveys in the vicinity of Station P and along Line P are available from the Ocean Ecology section at the Institute of Ocean Sciences.

SAMPLING AND ANALYTICAL METHODS

1. Electronic sensors

Sensors mounted on the OVP for this cruise were a Guildline Model 8701 digital CTD, a Variosens III in situ fluorometer configured to measure chlorophyll fluorescence, a Sea Tech 25 cm path length transmissometer measuring beam attenuation, and a Licor 193SB spherical quantum irradiance sensor measuring in situ PAR. Outputs from these sensors were multiplexed, digitized and communicated in serial mode to the surface via a 7-conductor armored cable. At the surface, data from the DAS were received by a Hewlett Packard 9826 computer, which provided real-time display of temperature, salinity and chlorophyll fluorescence with depth. Data were stored on a hard disk, and simultaneously backed up on magnetic tape and in printed copy. During a typical cast of the OVP, the package was lowered at a speed of 0.5 to 1 m s⁻¹ depending on sea conditions. At this time the electronic sensors were being sampled and logged at a frequency of 8 Hz. Decisions on the depths to collect water samples were based on the data acquired on the down-cast. The OVP was raised at a speed of approximately 0.5 m s⁻¹ and bottles were tripped while in transit. Data from all sensors were sampled and recorded at the time that each bottle closed.

2. Bottle data

a) Temperature

Duplicate temperatures from protected reversing thermometers were taken periodically as a check on the CTD temperatures. An offset correction was later applied to the CTD temperatures.

b) Salinity

Salinity samples were collected periodically as a check on the CTD conductivity measurement. These samples were analysed on our return from the cruise on an Autosal Model 8400 induction salinometer. An offset correction was later applied to the CTD salinities. All salinities are reported as dimensionless quantities.

c) Chlorophyll

The chlorophyll a content of phytoplankton samples was determined at sea using the fluorometric technique outlined in Strickland and Parsons (1972). Samples were filtered onto glass fibre filters. Whatman 934AH filters were used for some samples, while Whatman GF/F filters were used for others. 934AH filters have a nominal particle retention size of 1.5 μm . These allowed a significant proportion of smaller cells containing chlorophyll to pass through. The majority of cells, although probably not all (Venrick et al. 1987), were retained on the GF/F filters, which have a nominal retention size of 0.7 μm . A predictive relationship for GF/F-retained chlorophyll concentration from 934AH-retained concentration was obtained by a linear regression of 13 sample pairs analysed using both filter types:

$$\text{Chl}_{\text{gf/f}} = 1.3037 (\text{Chl}_{\text{934ah}}) - 0.0031$$

$$\begin{aligned} n &= 13 \\ r &= 0.979 \end{aligned}$$

This relationship was used to provide estimates of total chlorophyll a when normalizing photosynthetic parameters, as chlorophyll concentrations for samples that were used for ^{14}C uptake measurement were determined using 934AH filters.

d) Inorganic nutrients

Reactive nitrate-nitrite, phosphate and silicate concentrations were measured following the cruise by colorimetry on a Technicon II Auto-Analyzer. Water samples were quick-frozen immediately after collection and were kept frozen until analysis.

e) Primary productivity

Photosynthetic parameters were estimated from photosynthesis versus irradiance [P(I)] experiments. Water was drawn directly from rosette bottles into dark containers. Subsamples of 60 ml (21 light bottles, 2 dark bottles) were taken in the ship's laboratory. These were inoculated with 0.291 MBq $\text{NaH}^{14}\text{CO}_3$ and incubated for 2 hours. The subsamples were filtered onto 0.45 μm Millipore HA filters, which were fumed over concentrated HCl for approximately 30 minutes, and placed in scintillation vials to which 15 ml Aquasol (New England Nuclear) was added. Sample activities were determined later using an LKB 1217 scintillation counter, with counting efficiencies determined by the sample channels ratio method.

$P(I)$ data were fitted to the model of Platt et al. (1980) by a non-linear least squares fit using the Marquardt algorithm (Bevington, 1969). The model is of the form:

$$PB = P_B^* * (1 - e^{-\alpha I/P_s})(e^{-\beta I/P_s})$$

where: P_B^* = normalized productivity
(mg C (mg Chl a)⁻¹ h⁻¹)

P_B^* = maximum potential light saturated photosynthetic rate of the population
(mg C (mg Chl a)⁻¹ h⁻¹)

α = initial slope
(mg C (mg Chl a)⁻¹ h⁻¹ (μ Ein s⁻¹ m⁻²)⁻¹)

β = parameter characterizing photoinhibition
(mg C (mg Chl a)⁻¹ h⁻¹ (μ Ein s⁻¹ m⁻²)⁻¹)

Four derived parameters were calculated from these for each experiment:

$$P_m^* = P_B^* (\alpha / (\alpha + \beta)) (\beta / (\alpha + \beta))^{(\beta / \alpha)}$$

$$I_m = P_m^* / \alpha \log_e((\alpha + \beta) / (\beta))$$

$$I_k = P_m^* / \alpha$$

$$I_b = P_B^* / \beta$$

P_m^* is the maximum realized photosynthetic rate. I_m and I_k have utility as indices of photoadaptation, and I_b is an index of photoinhibition, representing the irradiance at which $PB = 0.37 P_B^*$ in the portion of the curve where $I > I_m$. All photosynthetic parameters have been normalized to chlorophyll concentration. The units of PB , P_B^* and P_m^* are mg C (mg Chl a)⁻¹ h⁻¹; the units of α and β are mg C (mg Chl a)⁻¹ h⁻¹ (μ Ein s⁻¹ m⁻²); the units of I , I_m , I_k and I_b are μ Ein s⁻¹ m⁻².

For each experiment, the variance of the data about the fitted curve was determined (Forbes et al., 1987), from which the correlation coefficient, r , was calculated.

3. Phytoplankton and zooplankton abundance

a) Phytoplankton

Paired samples were drawn from rosette bottles, with one sample preserved in alkaline Lugol's solution and the other in acid Lugol's solution (Throndsen, 1978). Cells were settled in counting chambers and counted on an inverted microscope. The names of the taxa are abbreviated in some cases and a complete taxonomic list precedes the data records as a guide to taxonomic order and abbreviations. This list includes all taxa recorded by Ocean Ecology surveys in British Columbia coastal waters and the northeast Pacific from 1978 to 1986. It may therefore be considered a reasonably complete checklist of phytoplankton occurring in these waters that can be identified by the technique used here. Samples in the data records are designated by station, rosette bottle number and preservation method. For example, 6-9N represents the sample collected at station 6, bottle 9, which was preserved with alkaline Lugol's solution. 6-9A is the sample from the same bottle preserved with acid Lugol's. If the preservation solution is not recorded, the results reported are combined data, with coccolithophorids enumerated from the alkaline sample and remaining taxa enumerated from the acid sample. Two samples were submitted blind to the analyst from each of station 21-7 and from 21-9. She was requested to count duplicate subsamples from each of these. This resulted in four sets of counts from each rosette bottle. The duplicate pairs from 21-7 are designated as 21-7W and 21-7X, and 21-7Y and 21-7Z respectively. The same numbering system was used for samples and subsamples from 21-9. The counts from all of these include material preserved in both alkaline and acid Lugol's solution. The analyst for all phytoplankton identification and enumeration was Rosemary Waters.

b) Zooplankton

Zooplankton sampling was performed with a Bioness multiple opening and closing net system. As for the phytoplankton data, abbreviations of taxa are used in the data records. A complete taxonomic list, with the abbreviations used, precedes the data records. A full tow consisted of an oblique haul with up to 8 samples acquired from specific depth strata. These samples are designated by station number and net number. For example J-2 represents the sample from net 2 at station J. A table following the data records provides details of the sample depths for each zooplankton sample. Samples were preserved with buffered formaldehyde. All samples were analyzed by Hugh Sefton.

ESTIMATED ACCURACY AND PRECISION OF DATA

1. CTD and other electronic sensors

The fundamental limit to resolution is given by the 12 bit accuracy (equivalent to 0.025% of full scale) of the analog to digital converter used. Manufacturers give the accuracy and resolution of the sensors as follows:

<u>Variable</u>	<u>Accuracy(±)</u>	<u>Resolution</u>
Pressure	1.25 dbar	0.25 dbar
Temperature	0.01 °C	0.003 °C
Equivalent salinity	0.01	0.005
% transmission	0.5 %	0.5 %
<u>In situ</u> PAR	7.00 %	0.50 %

2. Chlorophyll

Parsons et al. (1984) estimated that the precision (± 2) of the fluorometric method for replicate measurements at the 0.5 mg m⁻³ level should be better than 10 %. An estimate of the precision of the method as practised here was made on a previous cruise. The mean of 15 replicate samples (3 from each of 5 rosette bottles tripped at the same depth) was 3.01 ± 0.30 mg Chl a m⁻³ (± 9.8 %). The coefficient of variation was 4.9 %. Analysis of variance indicated no significant difference between samples drawn from one or more bottles tripped at the same depth (Ft = 0.307, Fr = 0.712).

3. Inorganic nutrients

Replicate analyses have been performed for 245 samples selected from four cruises by the Ocean Ecology section. Details are provided in detail in Denman et al. (1985). In summary, the expected percentage error for nitrate plus nitrite was 14.3 %, for phosphate was 9.4 %, and for silicate was 11.5 %.

4. Primary productivity

The mean coefficient of variation for 23 pairs of replicate light bottles incubated under identical irradiance was determined on a previous cruise to be 4.1 %, with a range from 0.02 % to 26.0 %.
