Canadian Data Report Of Hydrography and Ocean Sciences

Data reports provide a medium for the documentation and dissemination of data in a form directly useable by the scientific and engineering communities. Generally, the reports contain raw and/or analyzed data but will not contain interpretations of the data. Such compilations commonly will have been prepared in support of work related to the programs and interests of the Ocean Science and Surveys (OSS) sector of the Department of Fisheries and Oceans.

Data reports are not intended for general distribution and the contents must not be referred to in other publications without prior written authorization from the issuing establishment. The correct citation appears above the abstract of each report. Data reports are abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out of stock reports will be supplied for a fee by commercial agents.

Regional and headquarters establishments of Ocean Science and Surveys ceased publication of their various report series as of December 1981. A complete listing of these publications is published in the *Canadian Journal of Fisheries and Aquatic Sciences*, Volume 39: Index to Publications 1982. The current series, which begins with report number 1, was initiated in January 1982.

Rapport statistique canadien sur l'hydrographie et les sciences océaniques

Les rapports statistiques servent de véhicule pour la compilation et la diffusion des données sous une forme directement utilisable par les scientifiques et les techniciens. En général, les rapports contiennent des données brutes ou analysées, mais ne fournissent pas d'interprétation des données. Ces compilations sont préparées le plus souvent à l'appui de travaux liés aux programmes et intérêts du service des Sciences et levés océaniques (SLO) du ministère des Pêches et des Océans.

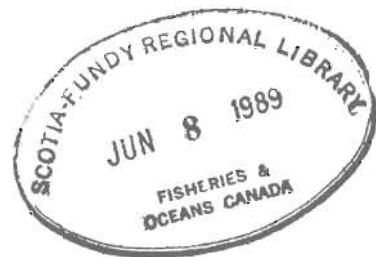

Les rapports statistiques ne sont pas destinés à une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans une autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports statistiques sont résumés dans la revue *Résumés des sciences halieutiques et aquatiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés sont fournis contre rétribution par des agents commerciaux.

Les établissements des Sciences et levés océaniques dans les régions et à l'administration centrale ont cessé de publier leurs diverses séries de rapports en décembre 1981. Une liste complète de ces publications figure dans le volume 39, Index des publications 1982, du *Journal canadien des sciences halieutiques et aquatiques*. La série actuelle a commencé avec la publication du rapport numéro 1 en janvier 1982.

ABSTRACT

Saunders K.S., Crewe N.F. and Pocklington R. 1989. Carbon and Nitrogen in Sediments of the Scotian Shelf and Adjacent Waters. Can. Data Rep. Hydrogr. Ocean Sci. No. 73: iv + 17 pp.

This report tabulates the results of total carbon, organic carbon and nitrogen determinations performed upon surficial sediments and subsamples from box cores. These were taken on four cruises to the Scotian Shelf and adjacent waters between the years 1982 and 1988 as an integral part of an ongoing program on sources and sinks of organic matter in coastal waters of Canada.

RESUME

Saunders K.S., Crewe N.F. and Pocklington R. 1989. Carbon and Nitrogen in Sediments of the Scotian Shelf and Adjacent Waters. Can. Data Rep. Hydrogr. Ocean Sci. No. 73: iv + 17 pp.

Ce rapport classe les résultats obtenus lors d'analyses d'azote et de carbone organique et total, pour des sédiments superficiels et d'échantillons de carottes prélevés lors de quatre croisières à la plate-forme Scotian et dans ses eaux avoisinantes.

L'échantillonnage faisait partie intégrante d'un programme des sources et d'enfouissement de matière organique dans les eaux cotières du Canada et eu lieu au cours des années 1982 à 1988.

ACKNOWLEDGEMENTS

Thanks are due to the officers and men of C.S.S. "Dawson" who over the years provided excellent ship-board help and to those members of Marine Chemistry (and its predecessor Chemical Oceanography) Division who helped with the on-board sampling.

INTRODUCTION

This report is a compilation of carbon and nitrogen determinations on surficial sediments (grab samples) and box cores from four cruises to the Scotian Shelf and adjacent waters (1982 - 1988).

Cruise 88-003 (figure 1) extended over Georges Bank, Browns Bank and the Scotian Shelf. Box cores were sampled from Emerald, Roseway and Georges Basins and the Lydonia Canyon (off Georges Bank). Fifty-six surficial sediment samples were also analyzed. Cruise 87-005 (figure 2) covered the area of Georges Bank, Northeast Channel and Browns Bank. Two box cores were analyzed; one from Emerald Basin and the other from the Corsair Canyon (off Georges Bank). Cruise 85-017 (figure 3) covered the Scotian Shelf and Slope. Five box cores were analyzed from Emerald, Roseway and LaHave Basins and Banquereau and Middle Banks. Ten surficial sediment samples were also analyzed. Cruise 82-006 was primarily to the Scotian Shelf and Slope (figure 4). Sixty-four surficial sediment samples were collected here.

METHOD

Surficial sediments were collected using a Van Veen grab. Box cores were subsampled at centimeter intervals; subsamples were frozen in glass bottles which were pre-rinsed with GC-grade solvent.

Samples were dried at room temperature in a vacuum oven using silica gel to remove excess moisture. An agate mortar and pestle was used to pulverize the samples before passing them through an 80-mesh (180 micron) sieve. A portion of the sieved sediment, approximately one gram, was treated with 5 ml of 1 molar HCl to remove the inorganic carbon by evolution of CO₂. The acid solution was allowed to evaporate by placing vials in a warm water bath and then dried at 50 degrees Celsius in preparation for analysis of organic carbon.

The sediment samples from cruise 88-003 and 82-006 were run once prior to treatment with acid and then duplicates for each sample were run after treatment with acid. For cruises 87-005 and 85-017, duplicates of the samples were run for total carbon then selected samples were treated with acid and duplicates analyzed.

The samples for cruise 82-006 were analyzed on the HEWLETT PACKARD 185B CHN analyzer by the method described in Pocklington & Morash (1979).

A CARLO ERBA elemental analyzer (model 1106) was used for the analysis of the remainder of the samples. Eight to twenty milligram samples were weighed into tin boats. The boats were introduced via an autosampler into an oxidation tube (1025 degrees Celsius), packed with chromic oxide and silvered cobaltous-cobaltic oxide, helium gas (25 ml min^{-1}) being the carrier. During sample introduction, the helium stream was temporarily enriched with pure oxygen. Flash combustion took place, primed by the burning of the tin container. The mixture of combustion gases then passed through a reduction tube containing copper, and the resulting gases were carried through a chromatographic column of Poropak QS that separated the individual components which eluted in the sequence $\text{N}_2 - \text{CO}_2 - \text{H}_2\text{O}$. Their concentrations were measured by a thermal conductivity detector and the results recorded on a Hewlett Packard 3390A integrator.

The instrument was calibrated using acetanilide, (standard reference material 141c, National Bureau of Standards, Washington, D.C.) which has a carbon to nitrogen atom ratio very similar to that of marine organic matter (Pocklington & Morash, 1979). Typically, standards ranged between 50 micrograms and 150 micrograms. Boat blanks were run to determine an average blank value and the values were built into the calibration. Standards were run at the beginning of the day and periodically throughout the day to ensure that the calibration remained true.

The following equations were used for carbon determinations:

(1)

$$K = \frac{A_{\text{std}}}{f_C * W_{\text{std}}}$$

$$K = \text{count } \mu\text{g}^{-1}$$

The instrumental response or sensitivity (K) is calculated by dividing the integration counts of the standard (A_{std}) by the fraction of carbon in the standard ($f_C = 0.7109$) multiplied by the weight of the standard in micrograms (W_{std}).

(2)

$$[C] = \frac{A_{\text{sample}}}{K * W_{\text{sample}}}$$

$$[C] = \text{ug of C / mg of sediment}$$

The concentration of carbon in the sediment sample is calculated by dividing the integration counts of carbon in the sample (A_{sample}) by (K) multiplied by the weight of the sample in milligrams (W_{sample}).

$$(3) \quad \text{C/N atom ratio} = [\text{C}] / [\text{N}] * 14 / 12$$

Excellent precision at 0.2 mg carbon/gram of sediment may be obtained from the analysis but the accuracy associated with the determination of less than 2.0 mg C per gram of sediment are questionable and therefore are reported as < 2. The C:N ratios are not included with these samples as ratios may be generated that have a high degree of uncertainty near the detection limit of both C and N.
