## **Canadian Data Report Of Hydrography and Ocean Sciences**

These reports provide a medium for the documentation and dissemination of data in a form directly useable by the scientific and engineering communities.

Generally, the reports will contain raw and/or analyzed data but will not contain interpretations of the data. Such compilations will commonly have been prepared in support of work related to the programs and interests of the Ocean Science and Surveys (OSS) sector of the Department of Fisheries and Oceans.

Data Reports are produced regionally but are numbered and indexed nationally. Requests for individual reports will be fulfilled by the issuing establishment listed on the front cover and title page. Out of stock reports will be supplied for a fee by commercial agents.

Regional and headquarters establishments of Ocean Science and Surveys ceased publication of their various report series as of December 1981. A complete listing of these publications and the last number issued under each title are published in the *Canadian Journal of Fisheries and Aquatic Sciences*, Volume 38: Index to Publications 1981. The current series began with Report Number 1 in January 1982.

## **Rapport statistique canadien sur l'hydrographie et les sciences océaniques**

Ces rapports servent de véhicule pour la compilation et la diffusion des données sous une forme directement utilisable par les scientifiques et les techniciens.

En général, les rapports contiennent des données brutes ou analysées mais ne fournissent pas d'interprétations des données. Ces compilations sont préparées le plus souvent à l'appui de travaux reliés aux programmes et intérêts du service des Sciences et Levés océaniques (SLO) du ministère des Pêches et des Océans.

Les rapports statistiques sont produits à l'échelon régional mais sont numérotés et placés dans l'index à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page de titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

Les établissements des Sciences et Levés océaniques dans les régions et à l'administration centrale ont cessé de publier leurs diverses séries de rapports depuis décembre 1981. Vous trouverez dans l'index des publications du volume 38 du *Journal canadien des sciences halieutiques et aquatiques*, la liste de ces publications ainsi que le dernier numéro paru dans chaque catégorie. La nouvelle série a commencé avec la publication du Rapport n° 1 en janvier 1982.

## ABSTRACT

Forbes, J.R., D.L. Mackas, R.M. Brown, K.L. Denman and E.A. MacIsaac. 1990. Zooplankton distribution and associated biological, physical and chemical data: Barkley Sound, Vancouver Island, April 1987 and May 1988 (MASS Program). Can. Data Rep. Hydrogr. Ocean Sci. 76: 139 p.

Data collected during April 1987 and May 1988 in Barkley Sound, southwest Vancouver Island, as part of the Marine Survival of Salmon (MASS) Program are presented. The objectives of this component of MASS were to survey the distribution, abundance and size frequency of zooplankton and investigate underlying biological and oceanographic processes controlling the zooplankton community. For 1988, maps of the surface distribution of zooplankton biomass by size category, salinity and temperature, obtained by a flow-through sampling system, are provided. Zooplankton identity, abundance and size distribution determined from vertical net haul and BIONESS samples, together with biological, physical and chemical observations from CTD/rosette casts are reported. Data from 1987 are restricted to zooplankton identity, abundance and size distribution determined from vertical net haul samples.

Key words: data, zooplankton, oceanographic, Barkley Sound, Vancouver Island

## RÉSUMÉ

Forbes, J.R.; D.L. Mackas, R.M. Brown, K.L. Denman and E.A. MacIsaac. 1990. Zooplankton distribution and associated biological, physical and chemical data: Barkley Sound, Vancouver Island, April 1987 and May 1988 (MASS Program). Can. Data Rep. Hydrogr. Ocean Sci. 76: 139 p.

Le document présente les données recueillies en avril 1987 et mai 1988 dans le détroit Barkley, au sud-ouest de l'île de Vancouver, dans le cadre du Programme de survie du saumon en mer (MASS). L'objet de cet élément du Programme était de relever la répartition, l'abondance et la fréquence des tailles de zooplancton et d'étudier les processus biologiques et océanographiques qui influent sur le zooplancton. Le document renferme des cartes de répartition en surface de la biomasse de zooplancton, selon la taille, la salinité et la température, établies à partir d'échantillonnages par instrument d'arpentage électronique. On y indique le type de zooplancton, l'abondance et la répartition par taille, déterminées à partir d'échantillons prélevés verticalement au moyen de filets et obliquement au moyen de système BIONESS, et à partir d'observations biologique, chimiques et physiques découlant de l'utilisation d'une système CTD/rosette. Les données recueillies en 1987 sont limitées à le type, l'abondance et la répartition par taille de zooplancton, déterminées à partir d'échantillons prélevés verticalement.

Mot-clés: données, zooplancton, océanographiques, détroit Barkley, île de Vancouver

#### ACKNOWLEDGEMENTS

We thank personnel of the C.S.S. Vector for their contribution to this project. Sharon Buckingham, Karen Burns, George Chase, Peter Clifford, Mark Gollner and Gedong Yin provided valuable field assistance. Alex Earmme performed some of the laboratory analyses while Shannon Cerniuk contributed to data reduction and analysis.

Specific analyses were performed under contract by the following individuals:

Nutrients - T. Smyth and staff, CB Research International Corp.  
Bacteria - S. Severn and staff, CB Research International Corp.  
Phytoplankton - R. Haigh and F.J.R. Taylor, U.B.C.  
Zooplankton - M. Galbraith, Sy-Tech Research Ltd.

## INTRODUCTION

The Marine Survival of Salmon (MASS) Program is an interdisciplinary study focussed on the relationships between physical and biological oceanographic events and the dispersal and survival of salmon during their early sea life. The program was stimulated by the need to improve forecasting for Pacific salmon returns. The return of adults appears to be strongly influenced by environmental factors and it is considered likely that these factors are operating on juveniles. The objective of the MASS program is to evaluate whether or not the variation in return rate is due to these effects on juveniles.

A major effort within the MASS program has been directed at processes within Barkley Sound, on the west coast of Vancouver Island. The Ocean Ecology section at the Institute of Ocean Sciences (IOS) has contributed to the research in Barkley Sound by surveying the distribution, abundance and size frequency of zooplankton, and investigating underlying biological and oceanographic processes controlling the zooplankton community. This report describes the results of an intensive study undertaken during mid-May 1988, with zooplankton data from an initial survey in late April 1987 conducted by the West Vancouver Laboratory of the Department of Fisheries and Oceans. The results of two additional surveys conducted in early May and early June 1989 are reported in Forbes et al. (1990).

## SAMPLING AND ANALYTICAL METHODS

### 1. Project design

The initial survey in 1987, for which we report zooplankton data, focussed on description of inlet-scale spatial variability of size-fractioned primary productivity and phytoplankton. Other results are reported by MacIsaac et al. (1990). Vertical net hauls were conducted at nine stations (Fig. 4) throughout Barkley Sound to characterize the size distribution of the zooplankton. Detailed taxonomic identification and enumeration of animals was undertaken on samples from four of these locations.

The types of studies done in 1987 were repeated in 1988, but we placed an increased emphasis on understanding the distribution and size structure of the zooplankton community. Nocturnal continuous underway mapping was conducted throughout Barkley Sound (Fig. 1-3) to obtain the surface distribution of zooplankton biomass by size category, salinity and temperature. Navigation was by Loran-C and radar. This mapping was augmented by a dense network (Fig. 5) of vertical net hauls, to obtain areal measurements of size-fractioned zooplankton biomass, and a series of oblique tows (Fig. 6) in the upper 10m, the depth stratum in which migrating juvenile salmon are concentrated. At one location we conducted a time-series of tows with a Bioness (Fig. 7) multiple net system, which provided information on diel variability in depth distribution of zooplankton. An additional day and night pair of Bioness tows was obtained at a second station (Fig. 7).

The zooplankton data were supplemented with continuous profiles and discrete samples for physical, chemical and biological water properties, collected with a CTD/rosette instrument (Fig. 8).

## 2. Continuous underway mapping

Continuous underway data of zooplankton abundance and size categories, salinity, temperature and chlorophyll fluorescence were collected with a flow-through electronic particle counting system (EPCS) (Mackas et al. 1981) coupled to temperature, conductivity and fluorescence sensors (Mackas et al. 1980). Water was pumped from a nominal depth of 3m via a through-hull fitting in the bow-thruster compartment. Mapping was performed at night to improve sampling of vertically migrating zooplankton. Data are averaged over 3km, and plotted (Fig. 12-20) along the line tracks at the mid-point of each 3km bin.

The zooplankton sensor counts and sizes particles with an equivalent spherical diameter of 0.3 - 3.0mm (approximately  $0.08 - 8.0\text{mm}^3$ ). Resistive particles passing through the sensor cause amplitude modulation of an A.C. excitation signal. Output pulses derived from the demodulated signal are an approximately linear function of particle volume, which allows particles to be assigned to one of ten size categories. The sensor contains four independent sensing tubes to allow for a high flow rate (approximately  $25\text{L}\cdot\text{min}^{-1}$ ). Precision of the size estimates ranges from about  $\pm 40\%$  for the smallest detected particles to  $\pm 10\%$  for the largest. The size categories of zooplankton are plotted as histograms, with the x axis as body size and the y axis as the amount ( $\text{mm}^3 \cdot \text{m}^{-3}$ ).

Periodic discrete water samples were taken from the system outflow for calibration of the temperature, conductivity and fluorescence sensors. However, high fluorescence interference from dissolved organic matter and non-living particulates rendered the fluorescence data suspect for deriving estimates of chlorophyll concentrations and the fluorescence data are not reported.

## 3. CTD/rosette casts and discrete water samples

Vertical profiles of physical, chemical and biological data were collected with an integrated array of instruments, including CTD, *in situ* fluorometer, transmissometer, and irradiance sensor, mounted in a frame attached to a rosette sampler. Specific sensors for this cruise were a Guildline Model 8701 analog CTD, Variosens III fluorometer, configured to measure chlorophyll fluorescence, Sea Tech 25cm path length transmissometer to measure beam attenuation, and Licor 193SB spherical quantum irradiance sensor, to measure *in situ* photosynthetically active irradiance. Outputs from these sensors were multiplexed, digitized and communicated to the ship. A microcomputer stored data and provided a real-time display of temperature, salinity and chlorophyll fluorescence. During a typical cast of the instrument package, it was lowered at a rate of  $0.5 - 1\text{m}\cdot\text{s}^{-1}$  and the depths to

collect water samples were determined from data acquired on the down-cast. The rosette sampler held an array of ten Niskin bottles. One or more of these bottles was tripped on the up-cast and data from all sensors were sampled and recorded at the time the bottle closed. Water collected by the Niskin bottles was used for discrete samples of salinity, chlorophyll a, dissolved inorganic nutrients, bacteria and phytoplankton.

The manufacturer of the CTD specifies an accuracy of  $\pm 0.01^{\circ}\text{C}$ , with a resolution of  $0.003^{\circ}\text{C}$  for temperature, an accuracy of  $\pm 1.25\text{dBar}$  and a resolution of  $0.25\text{dBar}$  for pressure, and an accuracy of  $\pm 0.01$  equivalent salinity, with a resolution of 0.005. For % transmission, the manufacturer specified accuracy and resolution to be 0.5%, while the accuracy of the *in situ* PAR measurement is reported to be  $\pm 7.0\%$  and the resolution to be 0.5%.

#### 4. Salinity

Salinity samples were collected in 250mL bottles which were rinsed three times, capped and stored for later analysis at IOS. Salinity samples were analyzed on a Guildline Autosal (Model 8400A) standardized against Standard Sea Water (Standard Sea-water Service, Institute of Oceanographic Sciences, Wormley, Godalming, England). Batch P95 8/3 1983 was used, with a stated  $K_{15} = 0.99997$  (chlorinity = 19.373). Data are reported in practical salinity units (psu) (Lewis and Perkin 1978).

Precision (pooled variance of replicate samples) of this method has been estimated by Macdonald et al. (1988) to be 0.005.

#### 5. Chlorophyll a

Extracted chlorophyll a was determined by fluorometry (Parsons et al. 1984). Water samples (generally 50mL) were filtered in duplicate onto 25mm diameter Whatman GF/F glass fiber filters with a vacuum of  $<100\text{mm Hg}$ . Just before filtration was completed approximately 1mL of  $\text{MgCO}_3$  suspension was added to the sample and the sides of the filter funnel were rinsed with filtered seawater. Chlorophyll was extracted in 90% aqueous acetone by grinding the filters in a tissue grinder. The extract was clarified by filtration through a glass fiber filter and the fluorescence measured in a Turner Designs 10 fluorometer. The sample was acidified with two drops of 1.5N HCl and the fluorescence was redetermined after the reading had stabilized to obtain a phaeopigment correction factor.

Chlorophyll a content was calculated from the equations in Parsons et al. (1984). The fluorometer was previously calibrated against a Perkin-Elmer Hitachi 200 spectrophotometer using a standard prepared from pure crystalline chlorophyll a (Sigma Chemical Co.). Chlorophyll concentrations in the calibration samples were calculated using the equations of Jeffrey and Humphrey (1975). The mean coefficient of variation of this method is estimated to be 4.9% (Forbes et al. 1988).

## 6. Inorganic nutrients

Samples for the analysis of dissolved nitrate plus nitrite, ammonium, orthophosphate and reactive silicate were analyzed using Technicon II Auto-Analyzer instruments. Processing of samples was handled in two ways.

### 6.a Frozen samples (method A)

Samples for the analysis of dissolved nitrate plus nitrite and orthophosphate were collected in 50mL glass tubes with Teflon cap liners. Samples for dissolved reactive silicate were collected in 20mL polystyrene tubes, also with Teflon cap liners. All sample tubes had been previously acid-cleaned and were rinsed three times with sample before filling. All samples were quick frozen in an alcohol bath to -40°C and stored frozen until analysis.

A Technicon II Auto-Analyzer was used for the analyses, with Technicon Industrial Methods No. 186-72 W and 158-71 W (both revised June 1977) employed for nitrate plus nitrite and reactive silicate respectively. The modification of the Technicon method by Brynjolfson (1973) was used for the analysis of orthophosphate. All glassware and plasticware used was acid-washed overnight in 1 M hydrochloric acid and rinsed three times with deionized (Milli-Q) water before use. Acid-washed sample cups were rinsed with sample before use. The recommendations of Macdonald et al. (1986) regarding the thawing of samples were followed and the samples were mixed thoroughly prior to analysis. A synthetic seawater wash solution and standards containing 3.2% sodium chloride (equivalent to 28 psu) were used for all samples except a small number of low salinity samples. These samples were analyzed using a synthetic seawater wash and standards containing 1.6% sodium chloride (equivalent to 14 psu). The low salinity samples were 41-6, 76-8, 76-9, 80-9, 82-9 and 85F-9, where the first number is the station identifier and the second is the bottle identifier.

Working calibration standard solutions were calibrated against substandards prepared from certified Sagami nutrient standards. The calibration standards were prepared fresh every one or two days and run at the beginning and end of each day, as well as after every 30 - 35 samples.

Concentrations of calibration standards used (in  $\mu\text{g-at.L}^{-1}$ ) were:

$\text{NO}_2 + \text{NO}_3$	$\text{PO}_4$	$\text{SiO}_2$
1.0	0.1	1.0
5.0	0.5	5.0
10.0	1.5	20.0
20.0	3.0	40.0
40.0	4.0	60.0

Turbidity samples were run on the orthophosphate channel (no reagents) for samples that were obviously turbid or of low salinity and sample concentrations were corrected accordingly.

The range of the method for nitrate plus nitrite is 0.1 to  $140\mu\text{g-at.L}^{-1}$ , with a stated precision of  $\pm 0.19$  at the  $17\mu\text{g-at.L}^{-1}$  level (standard deviation of four replicates). For orthophosphate, the range of the method is 0.01 to  $16\mu\text{g-at.L}^{-1}$ , with a stated precision of  $\pm 0.01$  at the  $1.3\mu\text{g-at.L}^{-1}$  level (standard deviation of four replicates). From a detection limit of  $0.2\mu\text{g-at.L}^{-1}$  the range for reactive silicate extends to  $300\mu\text{g-at.L}^{-1}$ . The stated precision of the method at the  $16\mu\text{g-at.L}^{-1}$  level is  $\pm 0.14$  (standard deviation of four replicates). Replicate subsamples representing at least 5% of the samples in each batch were analyzed as a check on method precision. In general, the precision of these replicates was within limits outlined for the respective methods.

#### 6.b Direct analysis (method B)

Subsamples for nutrient analyses were removed directly from the Niskin bottle with an acid-washed syringe and gently filtered through acid-cleaned, combusted ( $460^\circ\text{C}$  for 4 h) Whatman GF/F filters (mounted in 25 mm Millipore Swinnex filter holders) into acid-washed polyethylene bottles. Nitrate plus nitrite, ammonium and silicate samples were analyzed immediately, while orthophosphate samples were stored frozen ( $-20^\circ\text{C}$ ) until analysis.

Nitrate plus nitrite and ammonium were determined following the procedures of Wood et al. (1967) and Slawyk and MacIsaac (1972), respectively. Silicate was determined following Armstrong et al. (1967), and orthophosphate according to Hager et al. (1968).

Precision of method B based on Technicon Industrial Methods specifications is:

	Mean	1 Std dev.	N
Ammonia	1.00	0.06	10
Nitrate	5.00	0.06	10
Silicate	2.00	0.01	10
Phosphate	1.00	0.02	10

#### 8. Bacteria

For total counts of bacteria in seawater, water samples (20mL) were preserved with unbuffered formaldehyde to a concentration of 2%. They were stored at  $4^\circ\text{C}$  in the dark prior to counting. Abundance was estimated by the method of Hobbie et al. (1977), with slight modification. Duplicate subsamples were stained for five minutes with buffered acridine orange (0.1% in 0.02 Mol tris-hydroxymethylaminomethane, pH 7.2), to a final concentration of 0.02% (Bunch 1987), and filtered onto  $0.2\mu\text{m}$  pore-size Nuclepore polycarbonate filters, previously dyed with Irgalin Black (0.2% solution in 2.0% v/v acetic acid). Prior to filtration of the subsample, 1mL of surfactant (0.001M Triton-X) was passed through the filter to avert cell clumping due to the hydrophobic

property of the Nuclepore filters. Triton-X was selected because it does not affect the background fluorescence. Enumeration was by epifluorescence microscopy, with subsample volume (typically 5mL) chosen to distribute between 20 and 100 cells per field. Ten randomly chosen fields were counted. If the ten fields contained less than 300 cells, additional randomly chosen fields were counted until this number was reached.

The proportion of dividing cells was determined using the guidelines of Hagstrom et al. (1979). Bacteria cells showing a region of invagination, but no clear separation, were functionally designated as dividing cells. In general, the procedure for counting described above was used. However, if the dividing cell number was low (20 to 50 cells per ten fields), then an additional ten fields were counted.

A series of control samples was prepared by serial dilution, in filtered seawater, of a natural sample of bacteria. These were preserved with formaldehyde as above. These controls were counted several times during the counting of samples to ensure that temporal systematic variations in the procedures were not occurring. The mean coefficient of variation for 121 sets of duplicate subsamples was 17% with a range of 4 to 61%.

#### 9. Phytoplankton

Samples (250mL) were drawn from the Niskin bottles and preserved with acid Lugol's solution (Throndsen 1978). Identification and enumeration was by settling and inverted microscopy, as outlined in Hasle (1978). Specifically, each sample was shaken gently by hand for approximately 1 min. A subsample was then settled in a 10mL settling chamber, to yield between 100 and 300 cells or chains of the more abundant, medium-sized species present. Medium-sized and larger taxa were enumerated from the entire bottom at 250x magnification, unless numbers of abundant species exceeded 200. In this case, every second or every fifth transect was counted, depending on cell density. Smaller taxa occurring in large numbers were counted at 250x or 500x from two or more transects. The entire chamber was scanned for rare or exotic taxa.

#### 10. Zooplankton

Vertical net haul samples were collected with a bongo net (57cm diam., 0.25mm mesh, black netting) from 250m, or approximately 5m above the bottom where the depth was <250m. One subsample from each bongo haul was preserved with buffered formalin for identification and enumeration (only four samples analyzed); the other was frozen in an alcohol bath to -40°C for size-fractioned biomass determination. A series of oblique tows from 10m to the surface were also conducted with the bongo net. Samples were handled in the same manner as for the vertical hauls. Oblique tows through specific depth strata were performed with a BIONESS multiple opening and closing net system. A full tow consisted of up to seven samples, designated by station number and net number. For example, 52-2 represents the sample from net 2 at

station 52. Table 2 provides details of sample depths for each BIONESS sample. These samples were preserved with buffered formalin for identification and enumeration.

Size-fractioned biomass on frozen samples was determined as follows. Samples were thawed and passed through a stack of sieves with 4, 2, .85, .25 and .04mm mesh by gentle rinsing and backwashing in standing, filtered seawater. This was followed by a light rinse with isotonic ammonium formate (0.5N in deionized water) to remove salt. Subsamples were then filtered onto preweighed Whatman No.1 filter papers, dried for 24hr at 60°C, and the weight of the filter contents was determined. The .04mm sieve served as a check to detect animals passing through the .25mm mesh in a longitudinal direction. The occurrence of animals on this mesh is indicative of over vigorous sieving, requiring that the sample be re-sieved. The results are plotted (Fig. 9-11) in the form of histograms ( $\text{g}/\text{m}^2$  for each sieve) on a map at station locations.

For identification and enumeration of zooplankton, preserved samples were initially passed through a 5mm sieve onto a 0.04mm sieve to remove the preservative and to separate the >5mm size fraction from the rest of the sample. The latter was visually examined for exotic taxa, which were removed for external verification of identity. Generally, all remaining individuals in this size fraction were identified to species, sex and developmental stage where possible. In the event of a very large number of individuals, this portion of the sample was subsampled to approximately 50 individuals. The remaining size fraction (0.04 to 5mm) was split to produce a subsample of no fewer than 300 individuals, which were identified and enumerated to genus, species, sex and developmental where feasible. All subsampling was performed with a Folsom splitter, which was regularly calibrated by splitting a known control sample. A complete list of taxa (Table 7) precedes the abundance data (Tables 8-10). In some cases taxa are staged, sexed, or both. For example, *Calanus marshallae* 1-4 refers to stages 1 to 4 and *C. marshallae* 6f to stage 6, female of this species. In the case of some higher taxa, size categories are specified, for example *Oikopleura* s1, s2 and s3. S1 indicates a length of less than 5mm, s2 between 5mm and 1cm, and s3 greater than 1cm.

PHYTOPLANKTON IDENTITY AND ABUNDANCE

Table 5 Phytoplankton taxonomic list

Table 6 OE8805 Phytoplankton identity and abundance

TABLE 5: PHYTOPLANKTON TAXONOMIC LIST (WITH ABBREVIATIONS USED IN DATA RECORDS)

		Abbreviations in data records
Chrysophyta		
Chrysophyceae	Ochromonas spp.	ochromonas spp.
Ochromonadales		
Ochromonadaceae		
Dinobryaceae	Dinobryon spp.	dinobryon spp.
Dictyochales	Dictyocha speculum	dictyocha speculum
Dictyochaceae		
Chromulinales	Apedinella spinifera	apedinella spinifera
Pedinellaceae		
Haptophyta		
Haptophyceae		
Prymnesiales		
Prymnesiaceae	Chrysochromulina spp. (0-5um) C. spp. (6-10 um) C. spp. (10-15 um) Corymbellus aureus	chrysochro spp. 0-5 chrysochro spp. 6-10 chrysochro spp. 10-15 corymbellu aureus
Bacillariophyta		
Bacillariophyceae		
Centrales		
Corethronaceae	Corethron criophilum	corethron criophilum
Leptocylindraceae	Schroederalla delicatula Leptocylindrus danicus L. minimus	schroedere delicatula leptocylin danicus leptocylin minimus
Actinodiscaceae	Actinptychus undulatus	actinoptyc undulatus
Coscinodiscaceae	Melosira moniliformis Paralia sulcata Stephanopyxis nipponica Skeletonema costatum Thalassiosira spp. T. spp. (<10 um) T. gravida (syn. T. rotula) T. aestivalis T. anguste-lineatum T. eccentrica T. nordenskioldii Coscinodiscus spp. C. radiatus	melosira moniliformis paralia sulcata stephanopy nipponica skeletonem costatum thalassios spp. <10 thalassios rotula thalassios aestivalis thalassios anguste-line thalassios eccentrica thalassios nordenskiold coscinodis spp. coscinodis radiatus
Biddulphiaceae	Eucampia zoodiacus Cerataulina pelagica	eucampia zoodiacus cerataulin pelagica

TABLE 7: ZOOPLANKTON SPECIES LIST: CRUISES WV87 AND OE8805

Cnidaria	Bivalvia	Calanus marshallae
Medusae	Bivalve veligers	Calanus pacificus
Hydrozoa	Annelida	Calocalanus styliremis
Hydrida	Polychaeta	Candacia columblae
Euphysa	Polychaete trochophores	Centropages abdominalis
Sarsia	Polychaete larvae	Chiridius gracilis
Phialidium	Polychaete	Clausocalanus parapergens
Eutonia	Spirontid larvae	Clausocalanus pergens
Problsdactyla	Syllid	Ctenocalanus vanus
Trachylida	Tomopteris septentrionalis	Epilabidocera longipedata
Aglantha		Eucalanus bungii
Aegina		Eucalanus californicus
Siphonophora	Bryozoa	Euchaeta
Mugglaea	Cyphonautes larvae	Euchaeta elongata
Nanomia		Gaetanus intermedius
Ctenophora	Arthropoda	Mesocalanus tenuicornis
Tentaculata	Crustacea	Metridia
Pleurobrachia	Cladocera	Metridia pacifica
Nemertea	Evadne	Microcalanus pygmaeus pusillus
Nemertinea larvae	Podon	Neocalanus cristatus
Nematoda	Ostracoda	Neocalanus plumchrus
Mollusca	Conchoecia	Paracalanus parvus
Gastropoda	Copepoda	Pleuromamma xiphias
Gastropod veligers	Copepod nauplii	Pseudocalanus minutus/elongata
Pteropoda	Calanoida	Racovitzanus antarcticus
Limacina	Calanoida (unidentified)	Scolecithricella minor
	Acartia	Tortanus discudatus
	Acartia clausi	
	Acartia longiremis	
	Acartia tonsa	
	Calanus	

<b>Cyclopoida</b>		<b>Brachyura</b>		<b>Urochordata</b>
