## **Canadian Data Report Of Hydrography and Ocean Sciences**

Data reports provide a medium for the documentation and dissemination of data in a form directly useable by the scientific and engineering communities. Generally, the reports contain raw and/or analyzed data but will not contain interpretations of the data. Such compilations commonly will have been prepared in support of work related to the programs and interests of the Ocean Science and Surveys (OSS) sector of the Department of Fisheries and Oceans.

Data reports are not intended for general distribution and the contents must not be referred to in other publications without prior written authorization from the issuing establishment. The correct citation appears above the abstract of each report. Data reports are abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out of stock reports will be supplied for a fee by commercial agents.

Regional and headquarters establishments of Ocean Science and Surveys ceased publication of their various report series as of December 1981. A complete listing of these publications is published in the *Canadian Journal of Fisheries and Aquatic Sciences*, Volume 39: Index to Publications 1982. The current series, which begins with report number 1, was initiated in January 1982.

## **Rapport statistique canadien sur l'hydrographie et les sciences océaniques**

Les rapports statistiques servent de véhicule pour la compilation et la diffusion des données sous une forme directement utilisable par les scientifiques et les techniciens. En général, les rapports contiennent des données brutes ou analysées, mais ne fournissent pas d'interprétation des données. Ces compilations sont préparées le plus souvent à l'appui de travaux liés aux programmes et intérêts du service des Sciences et levés océaniques (SLO) du ministère des Pêches et des Océans.

Les rapports statistiques ne sont pas destinés à une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans une autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports statistiques sont résumés dans la revue *Résumés des sciences halieutiques et aquatiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés sont fournis contre rétribution par des agents commerciaux.

Les établissements des Sciences et levés océaniques dans les régions et à l'administration centrale ont cessé de publier leurs diverses séries de rapports en décembre 1981. Une liste complète de ces publications figure dans le volume 39, Index des publications 1982, du *Journal canadien des sciences halieutiques et aquatiques*. La série actuelle a commencé avec la publication du rapport numéro 1 en janvier 1982.

## ABSTRACT

*CA9ΦΦΦ397*

Ross, C.K. 1990. Currents and temperature data from northwestern Baffin Bay, September 1983 - September 1984. Can. Data Rep. Hydrogr. Ocean Sci. No. 78: viii + 227 pp.

This report presents a statistical and graphical description of the moored current meter and satellite-tracked data collected during the period September 1983 to September 1984 in northwestern Baffin Bay.

The presentation for current meter data takes the form of means over the length of the record and monthly means, ranges and standard deviations; time series plots of the hourly data and low pass filtered data; progressive vector plots; tidal constituents and spectra of velocity components. The presentations for the satellite-tracked drifters are listings of twice daily positions and track plots of each drifter. Composite plots of all drifter tracks for twenty-day periods are presented.

## RÉSUMÉ

Ross, C.K. 1990. Currents and temperature data from northwestern Baffin Bay, September 1983 - September 1984. Can. Data Rep. Hydrogr. Ocean Sci. No. 78: viii + 227 pp.

Le présent rapport expose, au moyen de statistiques et de graphiques, les données de courantomètre et de satellite recueillies entre septembre 1983 et septembre 1984 dans la partie nord-ouest de la baie Baffin.

Les données provenant des courantomètres sont présentées sous forme de moyennes sur la période considérée et de moyennes, amplitudes et écarts-types mensuels; de tracés de séries chronologiques des données horaires et des données de filtrage passe-bas; de tracés vectoriels progressifs, ainsi que de composantes de la marée et de spectre des composantes de la vitesse. Les données de repérage des dériveurs par satellite sont exposées sous forme de deux positions par jour et de tracés du trajet de chaque dériveur. On présente aussi des tracés combinés du trajet de tous les dériveurs par période de vingt jours.

**CURRENTS AND TEMPERATURE DATA  
FROM NORTHWESTERN BAFFIN BAY,  
September 1983 - September 1984**

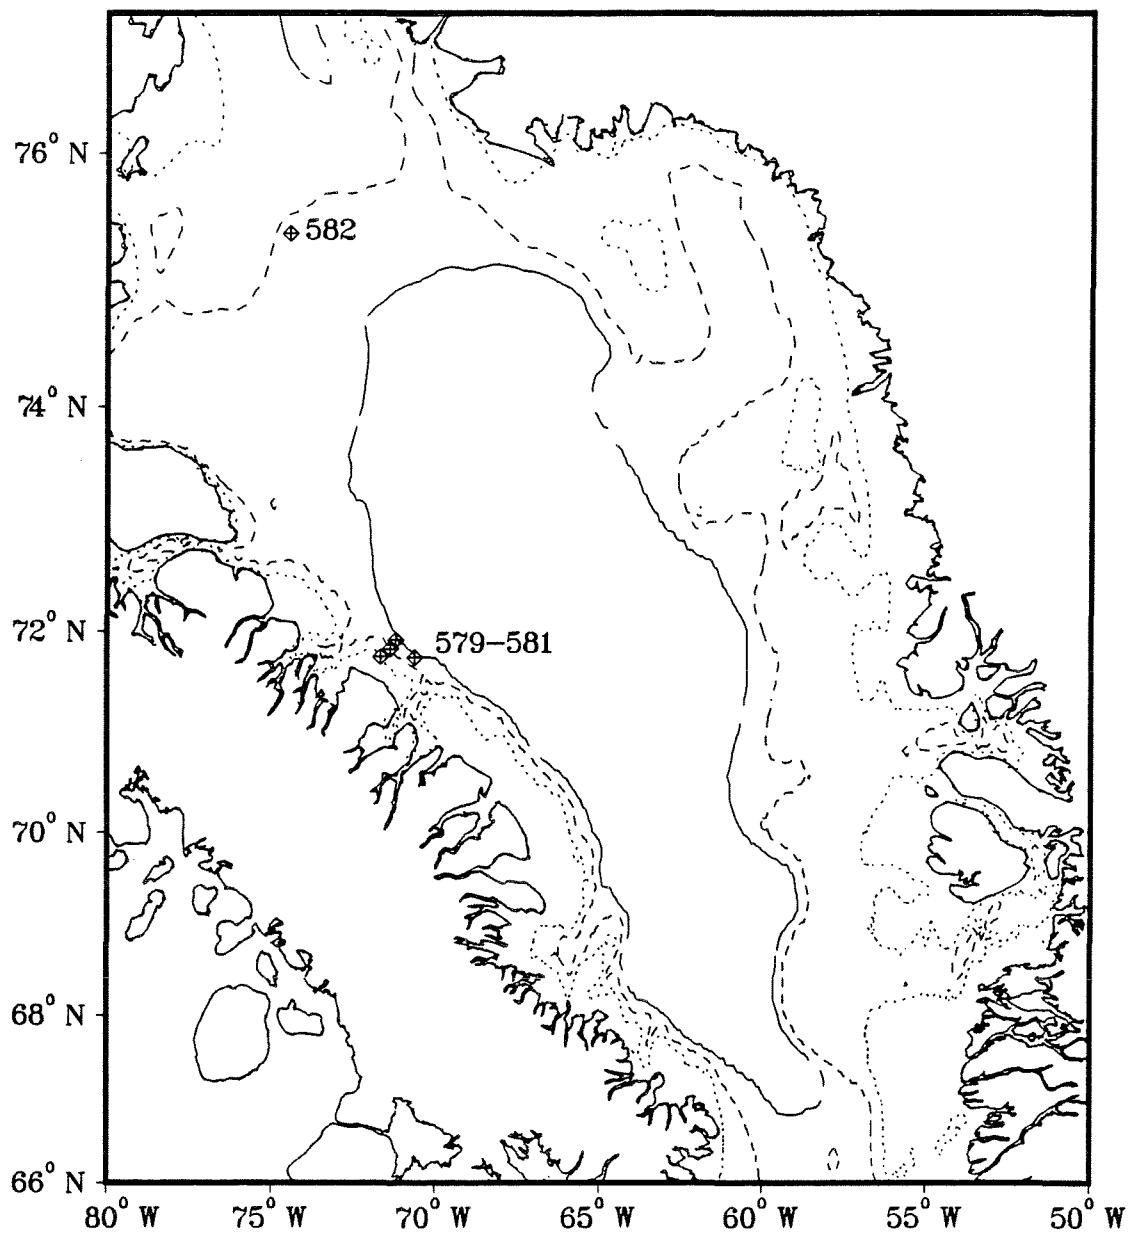

## **INTRODUCTION**

A program of year-long moored observations in Baffin Bay was started in the summer of 1983. The impetus for making these observations came from the expectation that hydrocarbons would be shipped out of the high Arctic in the near future. The Government of Canada set up the Northern Oil and Gas Action Program (NOGAP) to coordinate the government research in all areas affected by the exploitation of hydrocarbons in the Canadian Arctic.

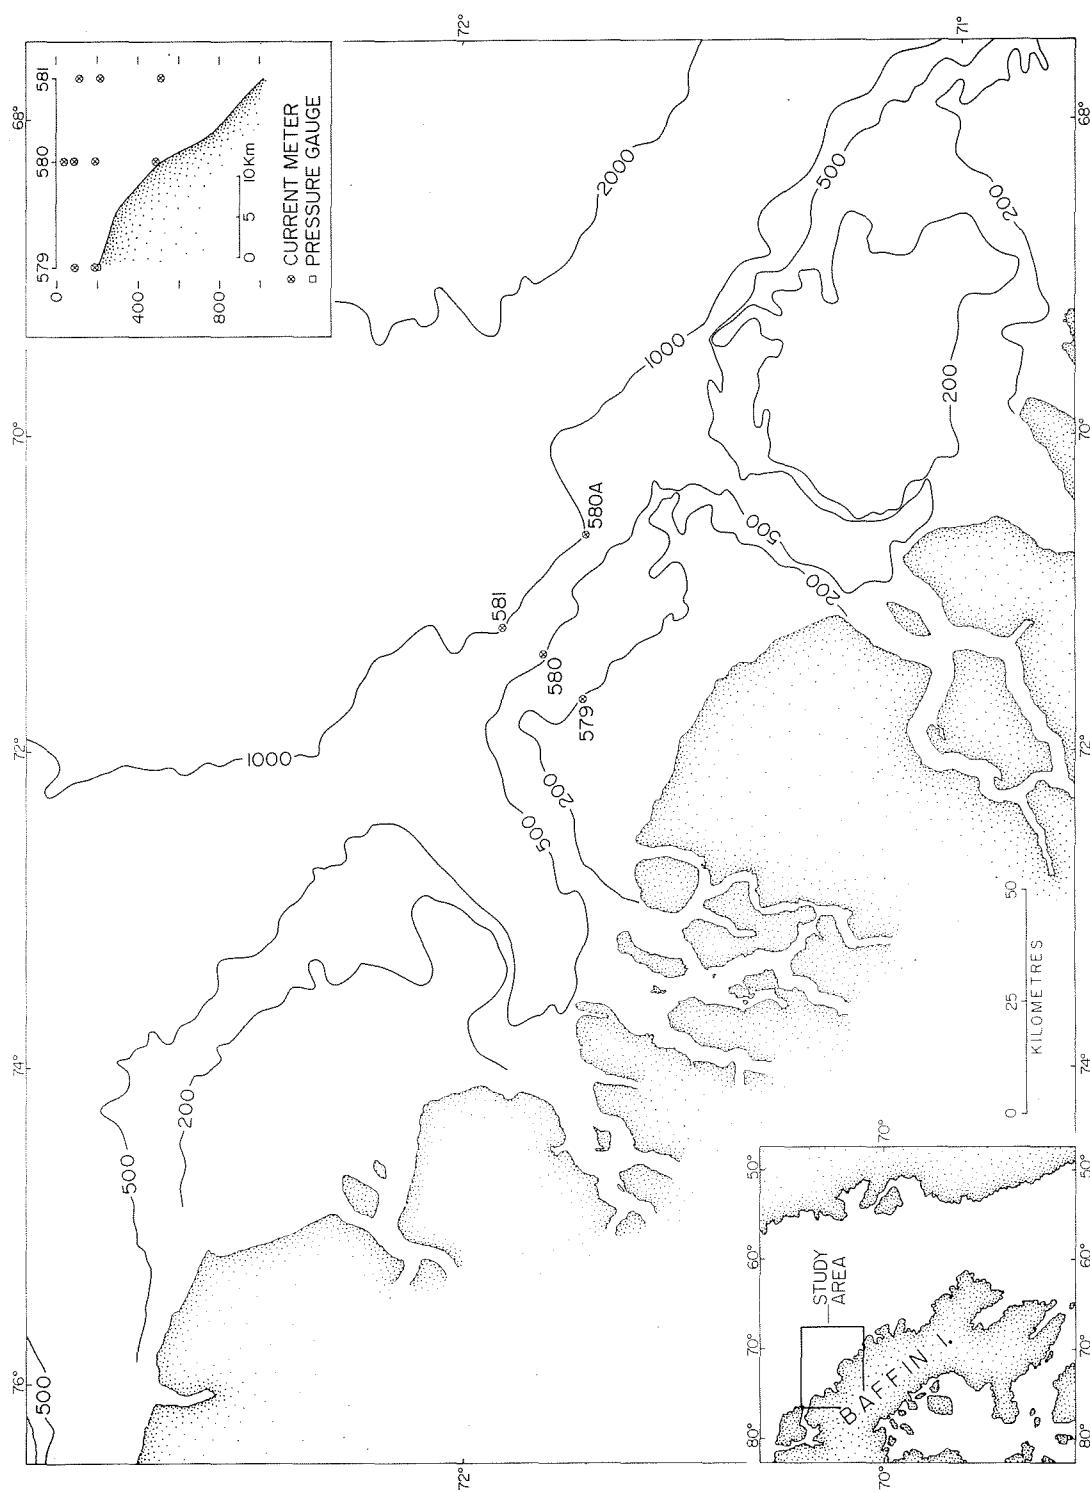

Very few direct observations of currents have been reported for Baffin Bay. One exception to this is the work of the Eastern Arctic Marine Environmental Studies (EAMES) in which a number of moorings and drifters were deployed in eastern Lancaster Sound and adjacent regions (Fissel, 1982; Fissel *et al*, 1982; deLange Boom *et al*, 1982).

A first year program was designed to take advantage of existing cruise plans for the summer of 1983. Four satellite tracked drifting buoys were deployed in northern Baffin Bay during a cruise of the Marine Ecology Laboratory (MEL). Later in the summer, staff of the Ocean Circulation Division of the Atlantic Oceanographic Laboratory (AOL) joined the CSS Hudson in Thule Greenland. During a leg of cruise 83-023 that was jointly planned for experiments by the Chemical Oceanography Division of AOL and the Biological Oceanography Division of MEL, time was made available to deploy three current meter moorings on the shelf and slope of northeastern Baffin Island and one in northern Baffin Bay.

## MOORINGS 1983-84

**FIGURE I :** Location of current meter moorings. Isobaths shown are 200, 500 and 1000 m.

**FIGURE II:** Detail location of moorings 579 - 581.

The moorings were recovered in September 1984 during cruise 84-039 on board CSS Baffin. The locations of the moorings (consecutive numbers 579, 580, 580A, 581 and 582) are given in figure I with more detail of the Baffin Island slope moorings shown in figure II. A listing of mooring particulars is given in Table I and Table II. Mooring 580 was deployed on 5 September, 1983 in 487 m of water and recovered 27 km eastsoutheast of the deployment position in 928 m of water. It was apparent that an iceberg had passed by, making contact with the mooring on October 30. According to the data record the rotor of the upper current meter was broken off on this date. It was dragged along until on November 17 the mooring was dropped into its final resting place. The data records collected after this time are assigned to mooring 580A.

Moorings 579 and 582 were both successfully located using the transponding releases (EG&G model 723A). On the release command they both indicated successful release but would not rise to the surface. The moorings were left in place until the following year when they were recovered using the submersible PISCES (cruise 85-063) operated by the Institute of Ocean Sciences, Sidney, B.C. An hydraulic cutting mechanism was designed by G. Fowler of the Metrology Division of AOL and fitted to the exterior of the submersible. The two moorings were successfully recovered in September, 1985.

ARGOS drifting buoys with identifications 5410, 5411, 5412 and 5413 were released in eastern and northern Baffin Bay. Buoy 5410 drifted into Greenland coastal waters and was recovered and re-deployed by the Greenland Command. The track of the re-deployed buoy is assigned the identification of 5410A.

## INSTRUMENTATION

The four moorings included 11 Aanderaa long-case RCM5's and one Aanderaa water level (i.e. pressure) gauge. The data from the water level gauge is reported elsewhere (Greisman *et al*, 1986). The current meters were of

the long-case design to move the instrument's compass away from the encoder. This is expected to improve direction reliability in this area where the earth's horizontal component of the magnetic field is weak (Keenan, 1979). Each instrument was equipped with current speed sensors, current direction, temperature and pressure sensors. Data were recorded at hourly intervals.

The manufacturer quotes accuracies for this instrument as: time within  $\pm 2$  s/d; temperature  $\pm 0.15^\circ\text{C}$  with a response time of 12 s; current speed  $\pm .01$  m/s with a threshold of .015 m/s; and current direction  $\pm 5^\circ$  for speeds above .05 m/s and tilt less than  $12^\circ$  from horizontal. The compass of each instrument was calibrated after recovery. CTP stations were occupied in the vicinity on deployment and recovery to verify the calibration of the temperature sensors.

The ARGOS buoys were manufactured by Hermes Electronics of Dartmouth, N.S. and are a modification of the FGGE drifting buoys. Each buoy included a temperature sensor in the hull. The temperature sensor is more accurate than our knowledge of what it is measuring. The temperature data are not presented in this report but are available from the author. Each buoy was fitted with a window-shade drogue centred at 35 m depth. There was no sensor to indicate if the drogues remained intact.

## DATA PROCESSING

The data recorded by the Aanderaa instruments were translated to computer readable files. The direction data are corrected by applying the calibration data from the compass swing and also corrected for the local magnetic variation as given on navigational charts for the area. The current speed is computed by applying a linear relationship to the encoder value according to the data supplied by the manufacturer. The current velocity is determined by taking the direction as the arithmetic mean of the direction data at the beginning and end of the speed integration period. The average speed/direction is then time-stamped at

the mid-point of the cycle. Temperature is computed by applying a cubic polynomial fitted to the results of a temperature bath calibration. Pressure uses a linear relationship.

The recovered data required almost no editing. A few obviously erroneous data values were manually removed from the records.

The data from the drifting buoys were received from Service ARGOS. These data were examined and any obviously erroneous data were removed. The data were transformed into an equi-spaced time series by averaging all data received in each of the twelve hour periods from 0000 to 1200 UTC and 1200 to 2400 UTC. The time of observation was assigned the mid-point of the period of averaging, regardless of when the positional data were determined.

## DATA PRESENTATION

Each time series from the moored current meters is presented either in its raw hourly form or as a low pass filtered time series. The filter used was a Cartwright filter with 129 weights that passes more than 95% of the input power for periods longer than 40 h, 50% at 31 h and less than 1% for periods shorter than 24 h. The resulting low pass time series are subsampled every 6 h.

A table of statistics and information on the location and times of deployment is given for each record. Statistics for each complete record include the number of observations for each sensor and the minimum, maximum, mean and standard deviation for each of pressure, temperature and speed as well as the current velocity in components to the northeast and southeast. These coordinates were chosen because the majority of instruments showed a mean current to the southeast on the Baffin Island slope and to the southwest in northern Baffin Bay. A listing of the mean and standard deviation of temperature, speed and the northeast/southeast

components of current velocity are given for each calendar month.

Time series plots of hourly values of direction, speed, north and east components of current velocity and temperature are presented for each record. Each record requires several pages as only 60 d of data are presented on each page. The hourly current data are used to form a progressive vector diagram with symbols every 10 d and labels every 60 d.

The low pass data are presented as a single page of the complete record of speed, northeast and southeast components of velocity, temperature and a stick diagram of velocities. For extra resolution the time axis is expanded to re-draw the stick diagrams with 60 d of data in each panel.

A table of the major tidal constituents ( $K_1$ ,  $O_1$ ,  $M_2$ ,  $S_2$ ,  $N_2$ ,  $M_f$ ,  $M_4$ ,  $MS_4$ ) is given for each current record. These constituents are determined from the maximum possible length of record.

Spectra are presented for the northeast and southeast components of velocity in two forms: log-log presentation of spectral power versus frequency and log-linear presentation of frequency times spectral power versus frequency (i.e. energy preserving display). The spectra are computed by using a fast Fourier transform on blocks of data (1024 h) that have had their mean and trend removed, averaging over variable (approximation to logarithmic) frequency space and averaging the estimates from each block. The standard error associated with the block to block variability of each spectral estimate is used to give the error estimate shown on each spectral estimate.

Each record for an ARGOS drifter has a table of the twelve-hourly positions of the buoy. A plot of the buoy's position relative to bathymetric contours is given with a symbol plotted at 2 d intervals. Following the data for the five individual records a chart of Baffin Bay is prepared for 20 d periods and the tracks of all buoys are shown.

Throughout, an attempt has been made to minimize the number of scales used for each presentation so that comparison from record to record may be made.

## ACKNOWLEDGEMENTS

I would like to express my gratitude to the many individuals who helped to gather, process and present these data. In particular the personnel of the ships CSS Hudson and CSS Baffin, the technical support of the Ocean Circulation Division and Coastal Oceanography Division of the Atlantic Oceanographic Laboratory, J.R.N. Lazier and D.N. Gregory for their useful comments, the Greenland Command and Dr. T. Platt and Dr. P. Jones for accommodating my late request for shiptime in 1983. Fully half of the current meter data would not have been available without the efforts of Mr. G. Fowler to design equipment for the PISCES submersible and to go down and retrieve the moorings.
