Canadian Data Report Of Hydrography and Ocean Sciences

Data reports provide a medium for the documentation and dissemination of data in a form directly useable by the scientific and engineering communities. Generally, the reports contain raw and/or analyzed data but will not contain interpretations of the data. Such compilations commonly will have been prepared in support of work related to the programs and interests of the Ocean Science and Surveys (OSS) sector of the Department of Fisheries and Oceans.

Data reports are not intended for general distribution and the contents must not be referred to in other publications without prior written authorization from the issuing establishment. The correct citation appears above the abstract of each report. Data reports are abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out of stock reports will be supplied for a fee by commercial agents.

Regional and headquarters establishments of Ocean Science and Surveys ceased publication of their various report series as of December 1981. A complete listing of these publications is published in the *Canadian Journal of Fisheries and Aquatic Sciences*, Volume 39: Index to Publications 1982. The current series, which begins with report number 1, was initiated in January 1982.

Rapport statistique canadien sur l'hydrographie et les sciences océaniques

Les rapports statistiques servent de véhicule pour la compilation et la diffusion des données sous une forme directement utilisable par les scientifiques et les techniciens. En général, les rapports contiennent des données brutes ou analysées, mais ne fournissent pas d'interprétation des données. Ces compilations sont préparées le plus souvent à l'appui de travaux liés aux programmes et intérêts du service des Sciences et levés océaniques (SLO) du ministère des Pêches et des Océans.

Les rapports statistiques ne sont pas destinés à une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans une autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports statistiques sont résumés dans la revue *Résumés des sciences halieutiques et aquatiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés sont fournis contre rétribution par des agents commerciaux.

Les établissements des Sciences et levés océaniques dans les régions et à l'administration centrale ont cessé de publier leurs diverses séries de rapports en décembre 1981. Une liste complète de ces publications figure dans le volume 39, Index des publications 1982, du *Journal canadien des sciences halieutiques et aquatiques*. La série actuelle a commencé avec la publication du rapport numéro 1 en janvier 1982.

Abstract

R.W. Macdonald, E.C. Carmack, M.C. O'Brien, F.A. McLaughlin, B.G. Minkley and K. Berger-North, 1990, Oceanographic Data Collected from the *Sir John Franklin* in the Beaufort Sea, September 1989. *Can. Data Rep. Hydrogr. Ocean Sci.*: **80**, 100 pp

A cruise to the Southern Beaufort Sea was carried out from the CCGS *Sir John Franklin* in August - September, 1989. Here we report the bottle data including salinity, temperature, nutrients (silicate, phosphate and nitrate), dissolved oxygen and chlorophyll a determinations, and the CTD data.

Key words: Arctic, Canada Basin, chlorophyll a, coastal zone, nutrients, oceanography, oxygen, salinity, temperature.

Résumé

R.W. Macdonald, E.C. Carmack, M.C. O'Brien, F.A. McLaughlin, B.G. Minkley and K. Berger-North, 1990, Oceanographic Data Collected from the *Sir John Franklin* in the Beaufort Sea, September 1989. *Can. Data Rep. Hydrogr. Ocean Sci.*: **80**, 100 pp

Une mission a été conduite dans la partie sud de la mer de Beaufort à bord du CCGS *Sir John Franklin* en août-septembre 1989. Dans le présent document, nous rapportons les données de salinité, température, nutriments (silicate, phosphate et nitrate), oxygène dissous et chlorophylle a qui ont été obtenues suite à cette mission, ainsi que les données CTP.

Mots-clés: Artique, Bassin Canada, chlorophylle a, zone côtières, nutriments, océanographie, oxygène, salinité, température.

Acknowledgements

We are very much indebted to the officers and men of the CCGS *Sir John Franklin* who assisted us in every way during the cruise and made it a pleasure to do the work. We especially note the skilled seamanship of Capt. D.S. McGarvie, the organizational effort of chief mate W. Coles, and the deck assistance of boatswain A. Miller and boatswain's mate A. Pittman. T. Juhasz did most of the ground work to prepare the ship for our cruise on very short lead time. We appreciate the efforts of Captain D. Johns (Coast Guard Northern) both for arranging this opportunity and for generously sharing costs; R. Wilson (IOS) acted as liaison between IOS and CCGS. P. Gamble designed and prepared the boxes which carried our gear; they certainly made a difference both in ease and in organization. We thank PCSP for their tolerance during our transfers to and from the ship, and the officers, men and hydrographers aboard the *John P. Tully* for tranporting much of our gear to and from the Beaufort Sea. S. Thomson assisted with advice on style, and with final text-editing. Charles Gobeil translated the abstract into French. This report forms part of the NOGAP B.6 series.

1 INTRODUCTION

The data reported here (IOS cruise 89-70) were collected from the Canadian Coast Guard Ship *Sir John Franklin* during a cruise to the Canadian Beaufort Sea from August 21 - Sept 5, 1989. For this cruise we had two broad objectives; a) Collect chemical and CTD data at a deep station in the Canada Basin, and b) Survey intensively the shelf break with the Mackenzie Canyon as a focus.

Data include:

- Conductivity-Temperature-Depth; using a Guildline CTD system.
- Water samples (hydrocasts at 6 shelf edge stations (≈ 200 m) and one deep station (3200 m)); salinity, temperature, dissolved oxygen, nutrients, (reactive silicate, phosphate, nitrate plus nitrite), and chlorophyll a.

Additional samples for tritium, C-14 and oxygen isotope composition were collected and several towed acoustic profiles (50 kHz and 200 kHz) were run; these data are not reported here, but will be entered into the electronic file when completed.

1.1 Stations

Station locations, shown in Figure 1, were determined from a transit Satellite Navigator by the ship's officers. The majority of positions are expected to be within 930 m of the true position, with a mean displacement of about 476 m [Huggett and Mortimer: 1971]. Our experience during this cruise in recovering moorings placed on the shelf with an independent Satellite Navigation system, leads us to believe that the above figures fairly reflect the precision of the navigation systems. The majority of stations were occupied near the shelf break. For most of these stations, as shown in Figure 2, the region was clear of ice during the cruise. For the A stations, which were at water depths of about 3200m, the ice cover was generally greater than 7/10.

2 METHODS

Sampling was carried out from the forward port side of the ship. Two winch pads were welded to the deck in St. John's, and these were used to mount IOS winches transferred from the *John P. Tully*. The ship's crane was used to suspend the block for either the CTD or hydrocasts. Both were done directly over the rail.

2.1 Guildline Conductivity-Temperature-Depth System

The Guildline model 8706 probe was equipped with a 1500 decibar pressure sensor. Data were logged via 2-conductor cable and slip rings to a deck unit (audio cassette). Simultaneously, data were recorded onto a Toshiba 3200 portable computer. Data were further processed and calibrated at IOS using procedures described in Cuypers *et al.*, 1988.

2.1.1 Data Validation

At stations A01, B09, B10, C01, C01E, D03, D10, and E01, bottle samples were collected and analyzed for temperature and salinity as part of the chemical program (see subsequent sections and the chemical data tables). The bottle data were used to cross check the CTD measurements. We made the comparison on a point by point basis, selecting regions of the profiles where gradients

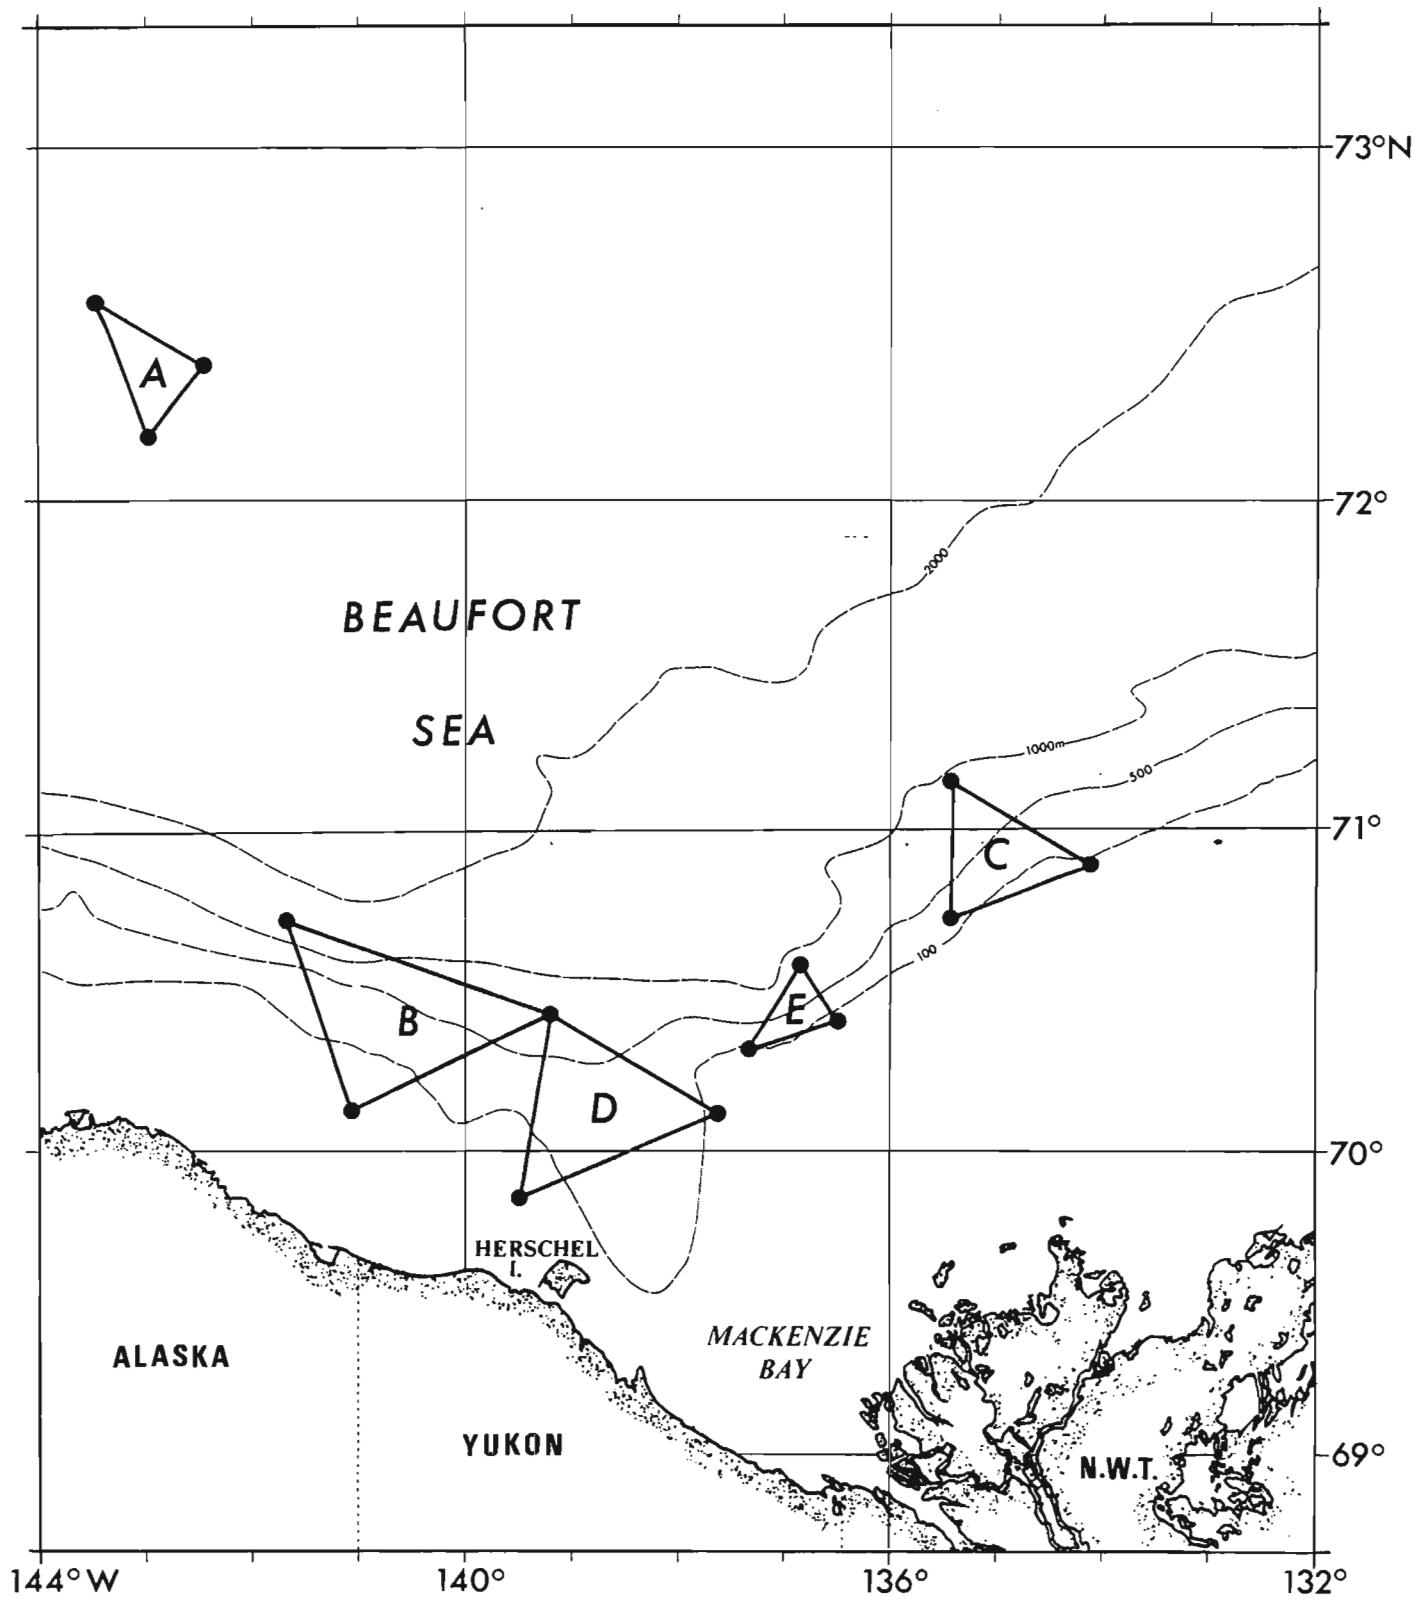

Figure 1: Station locations

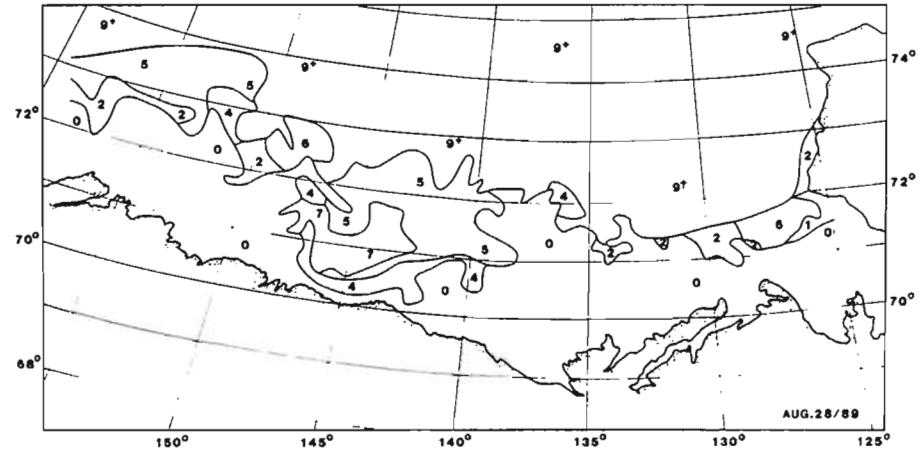

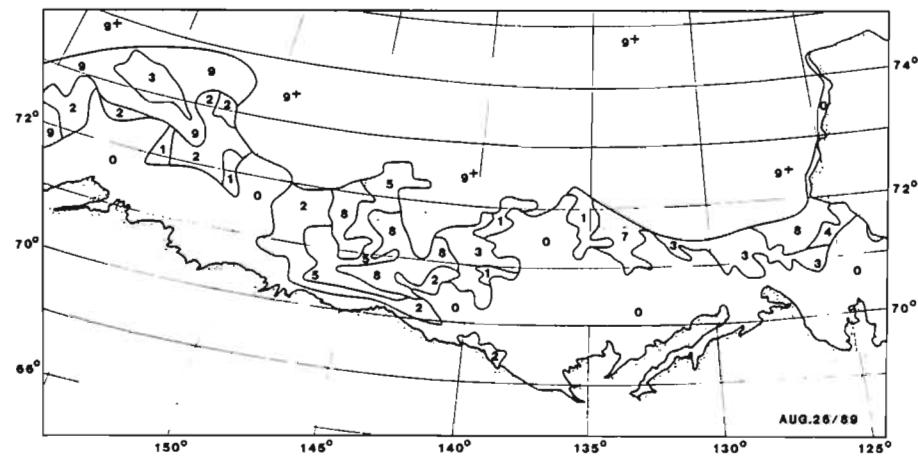

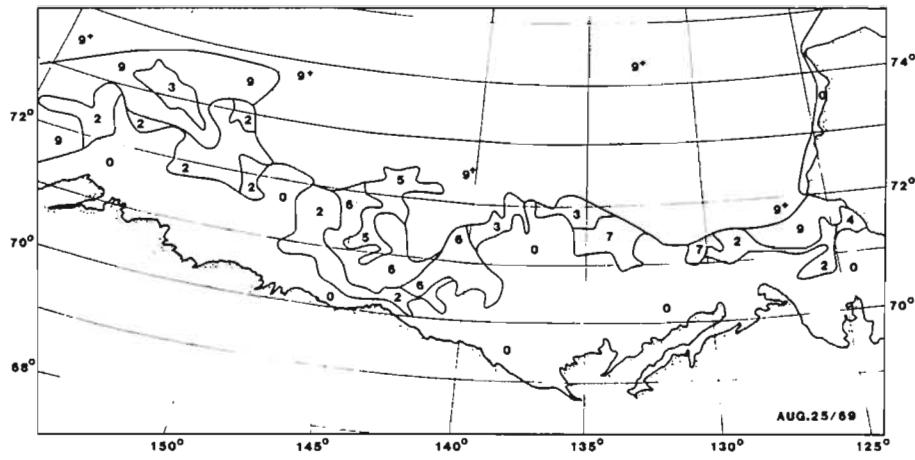

Figure 2: Distribution of ice coverage (in tens) during the cruise.

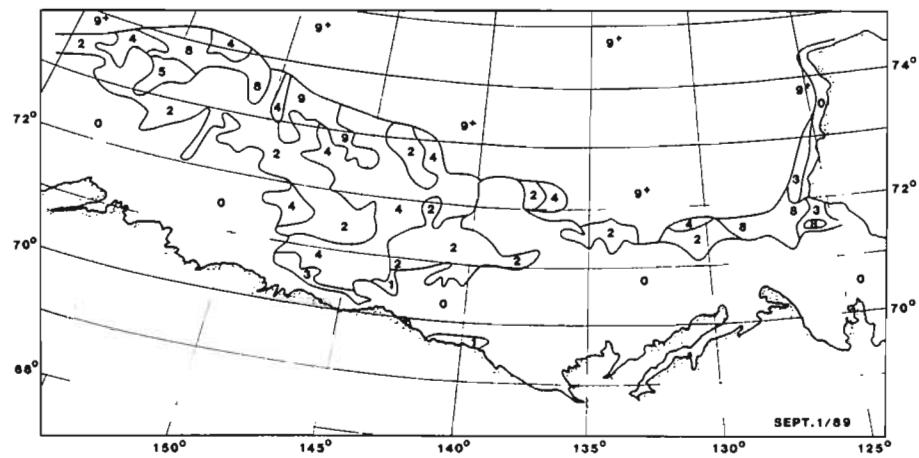

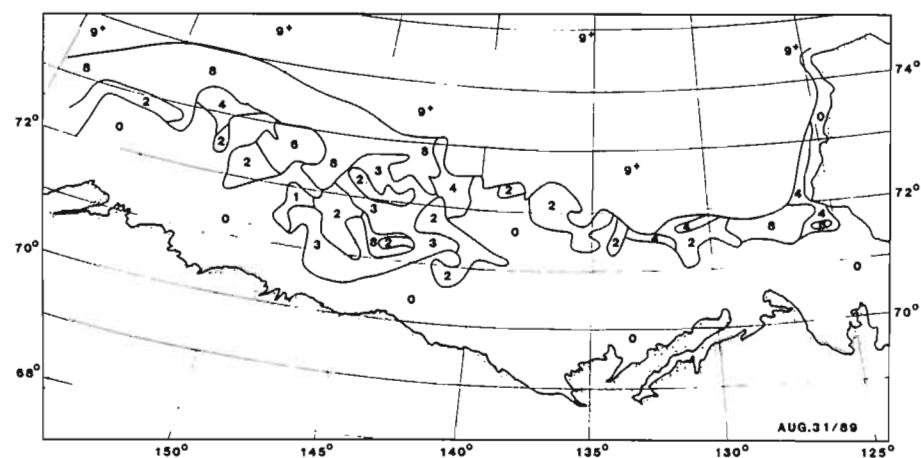

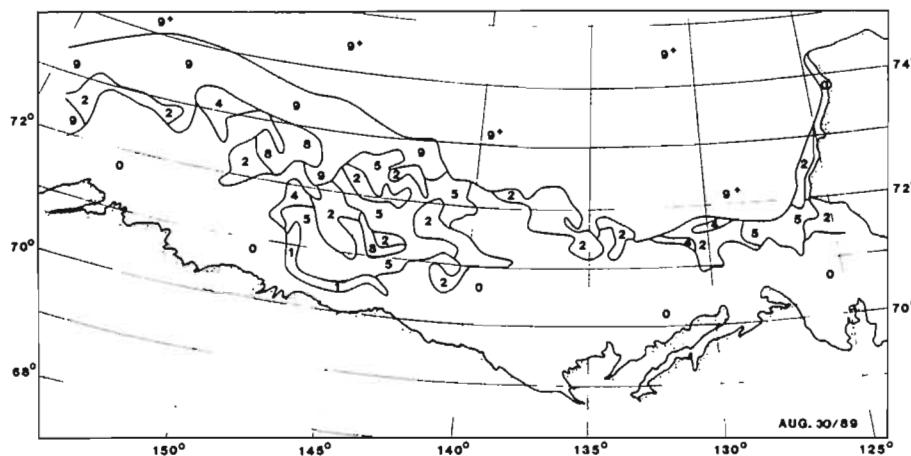

Figure 3: Distribution of ice coverage (in tens) during the cruise.

were small. It should be noted that the CTD casts and the bottle samples were **not** collected simultaneously, and that depth for the CTD was determined from the pressure sensor, while depth for the bottles was estimated by “wire out” (checked with unprotected thermometers where possible). Therefore, the differences in the intercomparison can be ascribed partly to environmental variance and partly to offset in depth between the two methods. With sufficient samples, however, we can examine with confidence the “average” offsets between bottle data and the CTD; we cannot measure salinity or temperature performance of the instrument while passing through strong gradients (e.g. poor temperature correction response, slow flushing).

To quantify the bottle - CTD intercomparison, the property differences $\Delta = X_{bottle} - X_{CTD}$ were calculated for each point (S and T) with the results reported in Table 1. There appears to be no significant offset in the Guildline CTD calibration in either temperature or salinity.

Table 1: Results of the Bottle and CTD Intercomparisons

	Salinity			Temperature		
	Δ	s	n	Δ	s	n
CTD - Bottle	-0.0050	0.019	22	0.0036	0.013	22

Units for salinity are in parts per thousand, and for temperature, Centigrade degrees; s refers to standard deviation, and n to the number of points at which Δ could be confidently calculated.

Error (noise) in the CTD measurement can be estimated by assuming the usual rule that variances add:

$$s_{\Delta}^2 = s_{bottle}^2 + s_{CTD}^2$$

Using the standard deviations calculated for the bottle data, we estimate for the Guildline CTD salinity measurements — $s \approx 0.02$ parts per thousand, and for temperature — $s \approx 0.02$ Centigrade degrees. The bottle cast and the CTD data were not collected at identical space/time coordinates, therefore this estimate of error also includes an environmental component and overestimates the instrumental error. From parts of the profiles where property gradients are low, it is apparent that the instrumental standard deviations are probably closer to 0.01, for both salinity and temperature. As noted, the above treatments do not include error which arises in steep property gradients where both sensor response and flushing times are long relative to environmental changes experienced by the instrument during its descent.

2.2 Water Chemistry

2.2.1 Field Sampling

Water samples were collected with either 5L or 1.7L Niskin bottles equipped with reversing protected and unprotected thermometers. Subsampling from the bottles followed the normal oceanographic procedure of first withdrawing dissolved oxygen (using latex tubing), followed by salinity, oxygen isotopes, and nutrients. Finally, the remaining water was transferred to a twice rinsed, 2L polybottle for chlorophyll a samples. Where Tritium samples were collected, they were taken directly after the dissolved oxygen sample.

Table 2: Estimates of error: basis of calculation and error models are given in the text.

measurement	units	precision (s_p)	Standard Reference Material
Salinity	psu	≤ 0.01	IAPSO Seawater
Temperature	°C	0.024	NBS Calibration
Silicate	mmol m ⁻³	0.13	Sagami SiO ₂
Nitrate	mmol m ⁻³	0.08	Sagami KNO ₃
Phosphate	mmol m ⁻³	0.04	Sagami KH ₂ PO ₄
Dissolved Oxygen	mmol m ⁻³	0.65	Sagami KIO ₃
Chl a	mg m ⁻³	0.04	No SRM available

2.2.2 Laboratory Methods

Errors for the various methods reported here are expressed as precision and accuracy as summarized in Table 2. Pooled variance, s_p , is calculated as

$$s_p = \sqrt{\frac{\nu_1 s_1^2 + \dots + \nu_i s_i^2}{\nu_1 + \dots + \nu_i}}$$

where $\nu_i = n_i - 1$ degrees of freedom, and the n_i and s_i refer to the number of replicates and their standard deviation for the individual components used in the pooled standard deviation calculation.

Salinity Salinity samples were drawn into 200 mL salinity bottles after 3 rinses from 1.7 L or 5 L Niskin bottles. The samples were then capped tightly until determination.

The salinities were analyzed on a Guildline Autosal (Model 8400A, SN 42.501) instrument at the Institute of Ocean Sciences; data are reported in practical salinity units (psu) [see *Lewis and Perkin*, 1978]. During analyses the instrument was standardized against Standard Sea Water of Chlorinity 19.374 ($K_{15} = 0.99991$). The Standard Sea Water was obtained from Standard Seawater Service (lot p107, 11th Nov, 1987), Institute of Oceanography, Wormley, Godalming, Surrey, England.

Standard deviation of repeated measurements on the same sub-sample was less than 0.0005 psu. Precision of the sampling/analysis was evaluated from independent duplicate samples drawn occasionally from the Niskin bottles; we found the pooled standard deviation, $s_p = 0.005$, $\nu = 9$.

Temperature Temperature was measured with paired oceanographic restricted-range thermometers (low temperature) manufactured by Richter and Weise (Berlin), Yoshino Factory (Tokyo) or Gohla (Kiel). These were read twice to the nearest 0.01 °C; precision, based on agreement between pairs, was $s_p = 0.024$ °C (for 145 pairs). Unprotected reversing thermometers were used to check depth as determined by the length of wire out.

Dissolved Oxygen Dissolved oxygen samples were 'pickled' immediately on deck and taken to the ship's laboratory for determination by the Micro-Winkler technique [*Carpenter*, 1965]. Analyses were carried out within 24 hours of collection. Calibration of the thio-sulphate solution was carried out with each titration set (daily) by using Sagami primary standard KIO₃. Precision of the method was routinely monitored with blind replicate samples drawn at a frequency of about 20% from the Niskin or Go-Flo bottles. For the data reported here we obtained the following results

on replicates: $s_p = 0.65 \text{ mmol m}^{-3}$, $\nu = 44$ (1 replicate pair with a difference of 6 mmol m^{-3} (0.13 mL/L) was removed by Chauvenet's criterion).

Nutrients Samples for nutrient determination were collected into twice rinsed glass and polystyrene test tubes (2 glass and 2 polystyrene tubes per sample).

Nutrients (silicate and nitrate plus nitrite) were determined in the ship's lab. Instrument problems forced us to freeze and store the phosphate samples for later determination at IOS. Nutrient determinations were performed using Technicon Autoanalyzer II components. Reactive silicate and nitrate plus nitrite were determined according to Technicon Industrial Methods No. 186-72 W and 158-71 W respectively, and soluble orthophosphate was determined using a modified Technicon method [Brynjolfson, 1973]. Sagami standards were used to calibrate secondary standards which were prepared daily in $30.5^{\circ}/\infty$ NaCl solutions.

Phosphate was determined in the laboratory at IOS on samples thawed and analyzed immediately.

Most of the nutrient samples were analyzed in duplicate, the average being reported. The precision of the determinations, based on these duplicates, was found to be: silicate, $s_p = 0.13 \text{ mmol m}^{-3}$, $\nu = 146$; phosphate $s_p = 0.04 \text{ mmol m}^{-3}$, $\nu = 142$; nitrate, $s_p = 0.08 \text{ mmol m}^{-3}$, $\nu = 134$.

Chlorophyll *a* Chlorophyll *a* samples were filtered in the ship's lab immediately upon sampling, taking care to restrict light. Water samples (1-3 L) were filtered through 24-mm diameter Whatman GF/C glass fiber filters. The inside of the filtration funnel was rinsed with about 10 mL filtered sea water and approximately 1 mL of 1% MgCO_3 solution was added to the samples just before filtration was complete. After filtration, the filters were folded in half, placed in filter paper folded into quarters, labelled, and stored frozen in a dark bottle containing silica-gel in a deep freezer. At IOS chlorophyll *a* was determined fluorometrically with a Turner Design fluorometer [Strickland and Parsons, 1972].

Blanks were estimated from deep samples (125 m and greater, where chlorophyll concentrations are low) to be 0.013 mg m^{-3} ($s=0.005 \text{ mg m}^{-3}$ $n=16$). Pooled standard deviation of replicates is estimated to be less than 0.04 mg m^{-3} ($n=12$) from previous field work [Macdonald *et al.*, 1988]. No duplicate chlorophylls were collected during the Franklin Cruise.
