Standards of service to the public

Statistics Canada is committed to serving its clients in a prompt, reliable and courteous manner. To this end, Statistics Canada has developed standards of service that its employees observe. To obtain a copy of these service standards, please contact Statistics Canada toll-free at 1-800-263-1136. The service standards are also published on www.statcan.gc.ca under "About us" > "The agency" > "Providing services to Canadians."

Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued co-operation and goodwill.

Interprovincial Employment in Canada, 2002 to 2011

by René Morissette and Hanging Qiu, Social Analysis and Modelling Division

This article in the *Economic Insights* series presents an overview of interprovincial paid employment over the 2002-to-2011 period. Interprovincial workers are individuals who maintain a permanent residence in a given province or territory but work in another. The results are based on Statistics Canada's Canadian Employer-Employee Dynamics Database and pertain to employees aged 18 or older who earned at least \$1,000 in 2002 dollars.

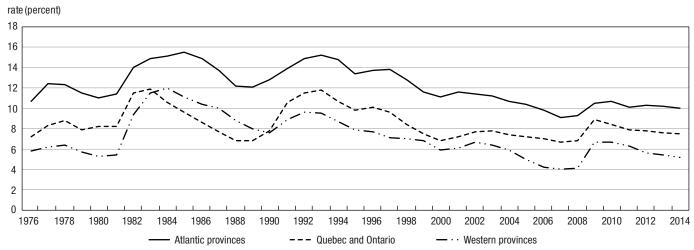

Introduction

In Canada, unemployment rates typically vary across regions. Over the past four decades, the Atlantic provinces have displayed higher rates than the central provinces of Quebec and Ontario or the Western provinces of Manitoba, Saskatchewan, Alberta, and British Columbia (Chart 1). Along with factors such as cross-regional differences in general economic performance and wage growth, these unemployment disparities provide employees with the incentives to migrate or to become interprovincial employees, that is, to accept jobs in other provinces while maintaining residence in their home province.

While several Canadian studies have analyzed the magnitude and correlates of interprovincial migration in the past, far fewer studies have examined interprovincial paid employment. Recent research has partly filled this gap,² but many questions remain unanswered.

One issue is the degree to which interprovincial employment represents a significant source of employment income for the home provinces of interprovincial employees. Interprovincial paid employment might be expected to be relatively more important in small sending provinces (for instance, Prince Edward Island and Newfoundland and Labrador) than in

Chart 1 Unemployment rate by region, 1976 to 2014

Note: Western provinces include Manitoba, Saskatchewan, Alberta, and Bristish Columbia. Source: Statistics Canada, Labour Force Survey.

See Day and Winer (2012) for a review of the Canadian literature on interprovincial migration.

Laporte, Lu, and Schellenberg (2013) sketch a profile of interprovincial employees working in Alberta; Laporte and Lu (2013) quantify the number of interprovincial employees coming from or working in different provinces during the 2004-to-2009 period. Interprovincial employment estimates in this article may differ slightly from those in Laporte and Lu (2013) because of updates and revisions to the data files being used.

larger ones. The degree to which sending provinces' aggregate employment income comes from interprovincial employment may also vary with the business cycle and world commodity prices.³ Indeed, as labour market opportunities declined and oil prices fell after the onset of the 2008/2009 global economic recession, interprovincial employment may have become a less important source of income than it had been previously.

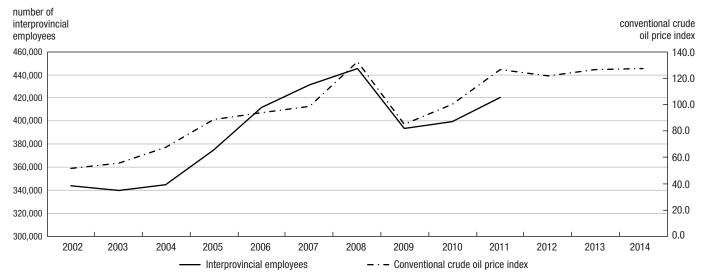

A second issue is whether interprovincial employees derive their earnings mainly from interprovincial employment or use it as a secondary source of income. On average, what percentage of interprovincial employees' earnings comes from interprovincial employment? How does this vary by sex and age group? More generally, how does the likelihood of being an interprovincial employee vary across these dimensions? This article answers these questions using data from Statistics Canada's Canadian Employer-Employee Dynamics Database (CEEDD).

Small provinces have a greater percentage of their workforce involved in interprovincial employment than larger ones

From 2002 to 2004, about 340,000 individuals aged 18 or older were interprovincial employees, accounting for 2.7% of the paid workforce (Chart 2). With economic expansion and rising world oil prices in subsequent years, interprovincial employment grew almost steadily, reaching a peak of roughly 445,000 in 2008.⁴ As the Canadian economy entered a recession and oil prices dropped, the number of interprovincial employees fell to 394,000 in 2009. The subsequent economic recovery and rebound in commodity prices brought the total to about 420,000 (or 3% of the paid workforce) in 2011.^{5,6}

Small provinces had a larger percentage of their paid workforce involved in interprovincial employment than did larger ones. Throughout most of the 2002-to-2011 period, interprovincial

Chart 2
Oil prices and number of interprovincial employees in Canada, 2002 to 2011

Note: Data for the number of interprovincial employees are not available after 2011.

Source: Statistics Canada, Canadian Employer-Employee Dynamics Database and CANSIM table 330-0008.

^{3.} The natural resource sector (including mining, oil and gas extraction, forestry products) is a relatively important segment of the Canadian economy. Increases in world prices for commodities such as crude oil, potash, and wood products—which raise output in this sector—may create substantial employment opportunities either directly or indirectly. These new employment opportunities may induce some workers to become interprovincial employees

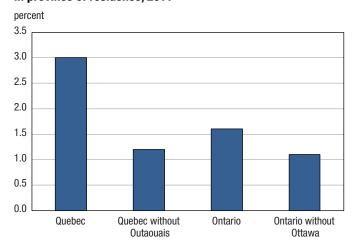

^{4.} As will be shown below (Table 7), the increase in interprovincial employees working in Alberta accounts for about two-thirds of the growth in the number of interprovincial employees in Canada from 2004 to 2008.

^{5.} The data in this paper for the years 2002 to 2009 are derived from the T1 Personal Master File (T1PMF), augmented with data from the T1 Historical File (T1H). Because the T1H is not available after 2009, the estimates for 2010 and 2011 are from the T1PMF and include province- or territory-specific adjustment factors. These adjustment factors are computed by comparing, over the 2003-to-2009 period, the T1PMF estimates with those obtained after augmenting T1PMF with T1H.

^{6.} The conventional crude oil price index fell from 128.1 in January 2014 to 78.3 in March 2015 (CANSIM table 330-0008).

employees who lived in Newfoundland and Labrador or Yukon represented at least 10% of the paid workforce of these jurisdictions.7 The corresponding percentages generally varied between 5% and 10% for Prince Edward Island, Nova Scotia, New Brunswick, Saskatchewan, and the Northwest Territories (Table 1). By contrast, interprovincial employees residing in Ontario represented, at most, 1.7% of the paid workforce of that province. About 3% of Quebec's employees were employed in another province or territory, a percentage that drops by more than half when Outaouais residents-many of whom work in Ottawa for the federal government—are excluded (Chart 3). Interprovincial employees from Manitoba, Alberta or British Columbia represented roughly 3% of the paid workforces of these provinces over the study period.

Chart 3 Interprovincial employees as a percentage of paid employment in province of residence, 2011

Source: Statistics Canada, Canadian Employer-Employee Dynamics Database.

Interprovincial employment accounts for a substantial percentage of aggregate wages and salaries of small provinces

ECONOMIC INSIGHTS

Because small provinces have proportionately more of their residents involved in interprovincial employment than do larger ones, they draw a greater percentage of their aggregate wages and salaries from interprovincial work. For example, 8.5% of the total wages and salaries earned in 2011 by all employees residing in Newfoundland and Labrador came from interprovincial employment (Table 2). This was more than twice as high as that for the territories or the four largest provinces—Quebec, Ontario, Alberta, and British Columbia. The corresponding percentages for Prince Edward Island, Nova Scotia and New Brunswick were 6.2%, 4.5%, and 4.6%, respectively.

For Newfoundland and Labrador, Saskatchewan, and British Columbia, more than half of the interprovincial employment income received in 2011 came from Alberta (Table 3). Wages and salaries earned in Alberta also accounted for 31% to 45% of interprovincial employment income received that year by Prince Edward Island, Nova Scotia, New Brunswick, Manitoba, and the Northwest Territories. Quebec drew 92% of its interprovincial employment income from Ontario, while Ontario obtained more than half of its interprovincial employment income from Quebec, partly owing to Outaouais residents working in Ottawa and Ottawa residents working in Gatineau for the federal government.8 Almost half of Yukon's interprovincial earnings were from British Columbia. The Northwest Territories, Ontario, and Quebec were the three largest sources of interprovincial earnings for Nunavut residents.

Earnings from interprovincial employment also represent a major source of interprovincial employees' total employment income. From 2002 to 2011, interprovincial employees from Quebec or Newfoundland and Labrador drew, on average, four-fifths of their annual wages and salaries from work done outside their province (Table 4). For all provinces except Alberta, an average of at least 60% of interprovincial employees' earnings came from interprovincial employment. At the other end of the spectrum, interprovincial employees from the Northwest Territories or Nunavut obtained no more than half of their employment income from interprovincial work. Thus, for the majority of interprovincial employees, interprovincial employment was their main source of employment income (Chart 4).

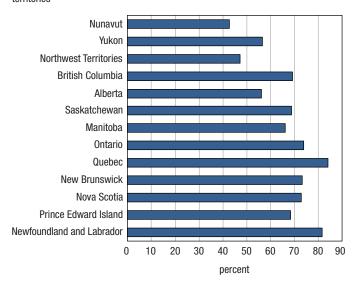

^{7.} Throughout the study, average annual paid employment, as measured from the Labour Force Survey (LFS), is used a denominator to estimate the incidence of interprovincial employment. An alternative strategy is to use as a denominator the number of individuals who have positive wages and salaries in a given year, as measured from the CEEDD data. Such an approach was used in Laporte, Lu, and Schellenberg (2013). Contrary to an LFS-based denominator, a CEEDD-based denominator is sensitive to changes in the number of short-term jobs. Since such changes might generate spurious movements in the incidence of interprovincial employment, the LFS-based denominator is used here. Because the LFS covered only about 70% of the Nunavut population before 2009, estimates of the incidence of interprovincial employment for Nunavut are based on the years 2009 to 2011.

Without the economic region of Outaouais, 73% of interprovincial employment income in Quebec came from Ontario in 2011. Without the economic region of Ottawa, 24% and 31% of interprovincial employment income in Ontario came from Quebec and Alberta, respectively.

Chart 4
Percentage of interprovincial employees receiving 50% or more of wages and salaries from interprovincial employment, 2011

Provinces and territories

Source: Statistics Canada, Canadian Employer-Employee Dynamics Database.

Differences by age and sex

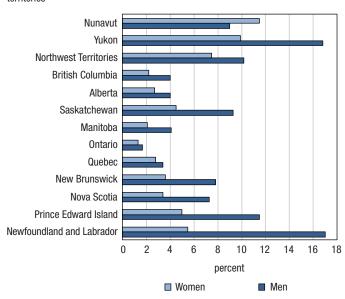

The incidence of interprovincial employment varies by sex and age. Men from all provinces and territories except Nunavut are more likely than women to be interprovincial employees (Chart 5). During the 2002-to-2011 period, the incidence of interprovincial employment among males in Newfoundland and Labrador averaged 17.0%, three times the rate (5.5%) among women (Table 5). For Prince Edward Island, Nova Scotia, New Brunswick, Manitoba, and Saskatchewan, the rate of interprovincial employment among men was roughly twice that among women.

Interprovincial employment is also most prevalent among younger employees. For all provinces and territories except Nunavut, women aged 18 to 24 were more likely to be interprovincial employees than were women aged 25 or older. Similarly, for all provinces and territories except Quebec and Yukon, men aged 18 to 24 were more likely than older men to be involved in interprovincial employment.

The share of earnings that interprovincial employees obtained from interprovincial employment also varies by age and sex. Men typically derive a larger share of their annual wages and salaries from interprovincial employment than do women (Table 6). For instance, in 2011, 72% to 84% of the earnings of male interprovincial employees from the Atlantic provinces came from interprovincial employment, figures that exceed those of their female counterparts by about 12 percentage points.

Chart 5
Interprovincial employees as a percentage of paid employment in province or territory of residence, by sex, 2002-to-2011 average

Provinces and territories

Note: Employees aged 18 or older earning at least \$1,000 (in 2002 dollars). For Nunavut, numbers are averaged over the 2009-to-2011 period.

Sources: Statistics Canada, Canadian Employer-Employee Dynamics Database and Labour Force Survey.

For all provinces and most territories, interprovincial employees aged 18 to 24 generally drew a smaller share of their total annual wages and salaries from interprovincial employment than did older employees. Hence, while young employees were involved in interprovincial employment more frequently than older employees, they relied on interprovincial employment as an income source to a lesser extent.

Interprovincial employees in receiving provinces

Thus far, interprovincial employment has been discussed from the perspective of the province or territory of residence (i.e. in terms of 'sending' provinces). It is also worthwhile considering it from the perspective of the province or territory of employment (or 'receiving' provinces).

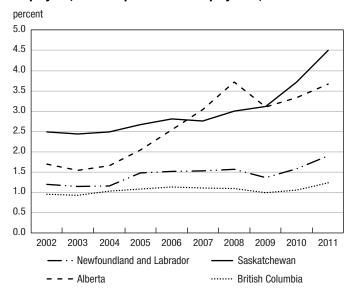

In absolute terms, 436,500 interprovincial employees worked in 'receiving' provinces or territories in 2011. Some of these individuals worked interprovincially in two or more provinces and hence the number of interprovincial employees in 'receiving' provinces exceeded the number from 'sending' provinces noted above. Ontario received the largest number of interprovincial employees in 2011 (Table 7) owing to the size of the provincial economy and employment flows within the Outaouais region.

In Alberta, the number of interprovincial employees reached 132,500 in 2008, and after declining to about 100,000 in 2009 and 2010 rebounded to almost 111,000 in 2011.

Throughout most of the 2002-to-2011 period, interprovincial employees working in Quebec represented about 1.5% of the paid workforce of that province. Interprovincial employees working in Newfoundland and Labrador, Ontario, Manitoba and British Columbia represented from 2.5% to 3.0% of the paid workforce of these provinces (Table 8). The corresponding percentages for Saskatchewan and Alberta were about 6.5% in 2011, up from 4% to 5% in the early 2000s. Interprovincial employees working in Yukon, Nunavut, or the Northwest Territories represented at least one-fifth of the paid workforce of these territories in 2011.

Interprovincial employees received approximately \$13.7 billion in wages and salaries (expressed in 2002 dollars) in 2011 (Table 9). Of all receiving provinces, Saskatchewan registered the largest share of employment income paid to interprovincial employees in 2011, at 4.5%, followed by Alberta, at 3.7% (Chart 6 and Table 10). In the territories, the share of employment income paid to interprovincial employees that year was substantially larger and varied between 9.9% and 22.6%.

Source: Statistics Canada, Canadian Employer-Employee Dynamics Database.

Summary

This article assessed the relative importance of interprovincial paid employment from the perspective of sending and receiving provinces of interprovincial employees. After a steady rise from 2002 to 2008, the number of interprovincial employees fell in 2009, but increased thereafter. By 2011, interprovincial employees accounted for 3% of employees in Canada, and 9% to 11% of the paid workforce residing in Newfoundland and Labrador, Yukon, and Nunavut.

In recent years, wages and salaries earned in other provinces made up a substantial percentage of aggregate earnings of residents of Saskatchewan, Yukon and the Atlantic provinces, especially Newfoundland and Labrador. Wages and salaries earned in other provinces were also the main source of employment income for the majority of interprovincial employees, indicating that interprovincial employment is, at least temporarily, a key determinant of the living standards of a subset of the workforce.

Men were more likely than women to be interprovincial employees, and male interprovincial employees received a larger share of their total earnings from interprovincial employment than women did. For both sexes, employees younger than 25 were more likely to be interprovincial employees than were those aged 25 or older, but obtained a smaller share of their earnings from interprovincial employment.

Of all provinces receiving interprovincial employees, Saskatchewan had the largest share of employment income paid to interprovincial employees in 2011 (4.5%). Using this metric, interprovincial employment played an even larger role in the territories.

The data in this article are cross-sectional, and do not indicate whether spells of interprovincial employment are of short or long duration. As well, the series ends in 2011 and does not capture the impact of changing economic conditions since 2011, including the recent sharp drop in world oil prices (since the mid-2014) on the number of interprovincial employees. Investigating these issues as more recent data become available is a task for future analyses.

^{..} not available for a specific reference period

Note: Employees aged 18 older earning at least \$1,000 (in 2002 dollars). The percentage of interprovincial employees is computed by dividing the number of interprovincial employees by average annual paid employment among individuals aged 18 or older in the province or territory of residence, as measured from the Labour Force Survey (LFS). Before 2009, the LFS covered only 70% of the population of Nunavut. For this reason, percentages for Nunavut are shown starting in 2009.

Note: Prevalence of interprovicial employment among employees aged 18 or older earning at least \$1,000 (in 2002 dollars). The percentage of interprovincial employees is computed by dividing the number of interprovincial employees by average annual paid employment among individuals aged 18 or older, as measured from the Labour Force Survey. Numbers for Nunavut are averaged over the 2009-to-2011 period.

Sources: Statistics Canada, Canadian Employer-Employee Dynamics Database and Labour Force Survey.

.. not available for a specific reference period

Note: Labour Force Survey coverage of Nunavut residents was about 70% prior to 2009. For this reason, estimates of the number of interprovincial employees as a percentage of the Nunavut workforce are shown only for the years 2009 to 2011.

Sources: Statistics Canada, Canadian Employer-Employee Dynamics Database and Labour Force Survey.
