### THE ASBESTOS MINING INDUSTRY IN CANADA, 1948

The asbestos industry recorded a new high in 1948 with production (shipments) of 716,769 tons valued at \$42,231,475, compared with 661,821 short tons worth \$33,005,748 in 1947. The province of Quebec is credited with the total production.

The 11 firms engaged in asbestos mining during 1948 employed 4,959 persons who received \$12,136,615 in salaries and wages. Fuel and electricity cost \$2,085,673, and process supplies, plus containers, cost \$5,771,229.

In 1948 the shipments of asbestos included 977 tons of crudes valued at \$594,594; 241,953 tons of milled fibres worth \$25,943,710 and 473,839 tons of shorts and refuse valued at \$15,693,171.

The following statement concerning asbestos mining in Canada has been abstracted from a review prepared by the Bureau of Mines, Ottawa:

"Asbestos of commerce consists mostly of the three varieties known as chrysotile, amosite, and crocidolite or blue asbestos, chrysotile being by far the most important and most widely used. Three other varieties, namely fibrous actinolite, fibrous tremolite, and anthophyllite, have only a limited field of usefulness.

"The asbestos produced in Canada is practically all of the chrysotile variety and comes almost entirely from areas of serpentinized rock in the Eastern Townships, Quebec, where the producing centres are Thetford Mines, Black Lake, East Broughton, Vimy Ridge, Asbestos and St. Remi de Tingwick. The Canadian deposits are the largest known in the world. Small deposits of Chrysotile asbestos are known in other parts of Quebec and also in Ontario and British Columbia, and several of them have been worked from time to time.

"No amosite or crocidolite has been found in Canada, but there are numerous deposits of fibrous tremolite, fibrous actinolite, and anthophyllite, which varieties are commercially termed amphibole asbestos. The fibres of these varieties are harsher and weaker than those of chrysotile and there is little demand for them at present. None of these deposits is being worked, although formerly fibrous actinolite was quarried near the village of Actinolite, Hastings County, Ontario, for use in the making of roofing materials. Asbestos deposits reported as having been found in recent years in Manitoba and in northern and western Ontario are of the amphibole varieties. The amphibole fibres are too harsh and brittle to be spun, but they have a higher resistance to acids than has chrysotile,

Note. This report was prepared by A. R. Deir, Mining Statistician.

and it is possible that material from some of the deposits is suitable for use in acid filters and for other purposes where long harsh fibres are required.

"Production has been continuous from the Thetford area since 1878 and reserves of asbestos-bearing rock are huge. Core-drilling to depths greater than 1,700 feet has revealed the presence of fibre comparable in quantity and quality with that in the present workings. Most of the output consists of vein fibre obtained from veins  $\frac{1}{4}$  to  $\frac{1}{2}$  inch in width, though veins exceeding 5 inches in width occur. The fibres run crosswise of the vein and thus the width of the vein determines the length of fibre. Slip fibre, occurring in fault planes, is obtained largely in the East Broughton area.

"The asbestos-bearing rock is mined in open pits and underground. The block-caving method of underground mining is coming into general use. This method was put into operation at the King mine of Asbestos Corporation in 1934. Johnson's Company is now using the same method, and Bell Asbestos Mines and Canadian Johnsonville are sinking shafts preparatory to recovering rock by block-caving operations.

"Asbestos is used for a great variety of purposes, the principal products being: cloth, brake linings, clutch facings, packings, insulation, mill-board, siding, shingles, roofing, tile and pipes."

Price quotations of asbestos, December 1948, were: crude No. 1, \$960-\$1,050 per ton; crude No. 2, \$492-\$550; spinning fibres, \$232-\$475; shingle fibres, \$95.50-\$141; paper stock, \$78.50-\$88; waste, \$58; shorts, \$27-\$52.

Canadian Chrysotile Asbestos Classification--(List of Standard Grades set up by the Committee on Uniform Classification and Grading of Asbestos Mines Products. This committee was formed in 1931 at the instigation of the Minister of Mines of the Province of Quebec, and the list of grades has been revised from time to time. Latest revision December 1942).

The asbestos mines products are divided into two classes: "Crude Asbestos" and "Milled Asbestos", respectively, defined as follows:

"Crude Asbestos" consists of the hand-selected cross-vein material essentially in its native or unfiberized form.

"Milled Asbestos" consists of all grades produced by mechanical treatment of asbestos ore.

"Crude Asbestos" and "Milled Asbestos" are sub-divided into groups designated and defined below.

Classification of the "Milled Asbestos" grades, in groups Nos. 3 to 7, inclusive, unless otherwise specified is based on the Quebec Standard Testing Machine.

"Shipping Test" is the average for each carload or smaller shipment, of tests representative samples taken at the time of shipping.

"Guaranteed Minimum Shipping Test" is that below which the actual shipping test shall not fall.

Group No. 1 Crude No. 1 Consists basically of crude  $\frac{3}{4}$  inch staple and longer  
 Group No. 2 Crude No. 2 Consists basically of crude  $\frac{3}{8}$  inch staple up to  $\frac{3}{4}$  inch  
 Crude run-of-mine Consists basically of unsorted crudes  
 Crudes sundry Consists of crudes other than above specified
