## MONTHLY REPORT ON INVENTORIES AND SHIPMENTS BY MANUFACTURING INDUSTRIES <br> IN CANADA, OCTOBER, 1948

This report continues the monthly series of indexes of the dollar value of manufacturing inventories and shipments. These series are collected on a sample basis from selected industries, and are indexed with December 1946=100. Data on individual industries include the index number for the current month, the previous month, and the same month a year ago. The trend in these industries for the entire period during which information has been collected, from December, 1946, may be ascertained by reference to the April, 1948 report.

For those interested in an economic use grouping of inventories, a presentation is made, in Section 1, of an index based on an astimate which is believed to approximate $90 \mathrm{p} . \mathrm{c}$. of the total value of manufacturing inventories. This estimate is based on the dollar value series plus information available on the physical volume of the chief types of stocks held in a limited number of industries. Because of the difficulties inherent in assembling and presenting this type of material, the Economis Use series always runs a month behind the dollar value series. For a more detailed explanation of both tables, see the texts preceding each section.

The overall pioture given by the end-of-September data shows a drop of 1.7 points since August in the index of total inventory values, giving an index of 148.3 per cent of the December, 1946 ievel. This is the first decline of more than one point in the index since the series was commenced in October, 1946. It rose during August by 2.1 points, and in September. 1947, the rise amounted to 2.2 points. The decline in inventories this month appears to have been due, in most cases, to unusually high shipments levels. In the majority of industries for which figures are avallable, shipments values were woll above the levels of the preceding few month, and, in most cases also, the increase was greater than the rise in shipments during September, 1947. In connection with these changes, it must be emphasized that variations in inventory and shipments values reflect price, as well as quantity, changes.

Of the main industry groupings, inventories of the consumers' goods industries foll slightly ( 1.3 points) to approximately the January level; capital goods inventories excluding shipbuilding. remained at the August level, but with the ship= building industry included dropped by 3.9 poirts; stocks of construction materials industries fell by 10.7 points. Producers' materials inventories rose by 2.1 points, the smallest increase in this group since April. In the consumers' goods group, inventories of finishod non-durable goods declined due to large seasonal decreases in stocks held by sugar refiners, alaghterers and meat packers, cheese factories and tobacco processors and packers fy Finished nonwdurable goods rose by 5.3 points, the largest increase in the group being a seasonal rise in stocks held by the flour and foed industry. Consumers' semi-durable and durable goods industries both showed
slight decreases in the total value, the largest individual declines being in the rubber coods, electrical apparatus and supplies, and clothing industries. The rise in inventories of the producers' goods industries was general among most of the large industries in the group, only the sheet metal products industry showing a significant decline. In the capital goods' group, as well as the large drop in shipbuilding inventories, there were small declines shown in the agricultural implements and railway rolling stock industries. The latter were balanced by slight increases in other industries in the capital goods category. A seasonal decline in stocks of sawmills. and a slight fall in inventories in the bridge building and structural steel industry, accounted for the large decrease in the index of the construction goods industries.

Some indication of the trend in inventory values at the end of October is also apparent when a combination is made of advance information on physical stocks with the dollar values for the individual industries which are indexed in Table 2 of this report. These indications point to no change, or a very slight rise, in total inventory values during Uctober of the main industry groupings, consumers' goods inventories appear to have incressed in value somewhat, after their decline in Soptember, and stocks of producers goods have incresssd slichtly more than in the previous month. On the other hand, inventories of capital goods have declined slightly. Construction gcods inventories appear to be fallon considerably, but figures for sawmills, the largest component of this group are not yet available.

A breakdown of the larger groupings shows that in the consumers' goods group, stocks in the food industries appear to be up, after declines in each of the three previous months. Inventories held by sugar rofiners. and slaughterers and meat packers have increased. Butter and cheese declined; though total stocks are lower than last year, the October decrease does not appear to have besn as large as in 1947. Inventories in the tooacco and beverage group have increased, mainly due to a large increase in tobacco warehouse stocks, though stocks of raw tobacco hald by packers continued their seasonal decline. Feed and flour, and pulp and paper inventories both increased, following their regular seasonal pattern. Inventories in most of the semi-durable consumers goods industries, consisting of clothing, textiles. rubbor and leather coods, appear to have declined slightly, but no figures are yet availatle for leather tanneries, where stocks have probably increased. Durable consumers' goods inventories have fallen, led by the electrical apparatus and supplies industry which showed a three-point drop.

The majority of industries in the capital goods industries registered slight decreases in inventory values, largest being in the railway rolling stock and shipbuilding industries. These were balanced to some extent by small increases in the machinery and agricultural implements industry. In the construction goods group also, most industries showed declines, led by a 35 point drop in the bridge building and structural steel industry. (It may be noted that the railway rolling stock, shipbuilding, and structural stael industries are all somewhat special cases, since inventories here include almost the sntire value of current production up to the point where major deliveries are made.) Increases in inventory values were general among allindustries in the producers' goods group.

## SECTION I.

The estimates in Table 1 have been based on two types of source materials. In most industries totals were estimated from data submitted by a sample of leading firms which report the value of their inventories and shipments monthly. Though the size of the sample varies to some extent from industry to industry, in most cases the firms reporting hold over half of all the inventories held in the industry and in a number of instances the sample includes more than 90 per cent of the total. In a smaller group of industries estimates have been based on information available on the physical volume of the chief types of stocks held in these industries. By use of data on prices and on the rato at which these stocks turn over, an estimate of the current value of these inventories has been made. Because no information is available on the accounting methods used by the firms in these industries the value of inventories shown for them cannot be expected to correspond exactly to their own book value but it does show the general trend of inventories in these industries and makes it possible to build up an overall pictire for the manufacturing field.

The total in mable 1 has been presented in detail according to an economic use classification. In this classification goods have been grouped according to whether production consists primarily of consumer goods, capital goods, producere' materials or construction materials. This form of presentation corresponds to the type of use which is ultimately made of the goods produced by various industries. Because some industries produce goods which fall in more than one of these main groups the classification can only be approximato in nature and in allocating certain industries fairly arbitrary decisions had to be made. In time some further grouping of plants within industries should rake it possible to improve the accuracy of this presentation.

Within the consumer goods group a further subdivision has been shown on the basis of whether the product is primarily of a perishable, a semi-durable, or a durable nature. This form of presentation has been widely used in recent years and corresponds to the form in which consumer expenditures, part of the country's gross national expenditure, are presented. This should be useful to all those who aro interested in the general flow of goods from the primary producing stage to their ultimato destination.

# MONTHLY REFORT ON INVENTORIES AND SHIFMENTS BY MANUFACTURING INDUSTRIES 

## Section 2

Date available from the sample monthly survey of ehipments and inventories of manufacturing industries are incorporated. insofar as inventorios are concerned, into Table I, but it has been thought advisable to show individual industries wherever possible. Since this is a semple survey, covering only selected firms in a special group of industries, the dollar values actually reported by the firms have been converted into index numbers representative of industries, or groups of industries, the base being December. 1946. The index presentetion avoids the possibility that dollar value totals for firms might be mistaken for dollar value totals for industries. However, when considering the series presented hereinafter, in table 2, it must be borne in mind that the divisions are industry divisions, and not commodities, i.e.. the wool Cloth Industry does not represent the shipments and inventories of mool Cloth only, but all commodities involved in the activities of firms whose major products is Wool Cloth.

Also, it must be emphasized most particularly that the index numbers shown in this serios are based on the dollar values of inventories held, not on actual physical quantitios. Even apart from the fact that dollar values are required by economists interested in investment in inventory, it is obvious that the value approach is the only practical one, considering the wide range of commodities held by mamafacturers in all stages from raw materials to finiahed producte ready for sale. However, the value of commodities in stock is the result not only of raw material costs, but also of the cost of making them. Thus, if prices or labour costs rise the value of the goods held increases, even though the quantity may remain the same. Therefore, changes shown from month to month by the index numbers represent not only guantity changes but also the changes in the value of each item included. The only indication of the extent to which values of items have changed is the trend shown by the index of prices published in the "Canadian Statistical Review".

The Bureau is at present attempting to devise a means of deflating the inventory series in order that quantity changes may be refiected more accurately. For those interested in this problem, some of the factors which must be taken into consideration may be noted. While each industry has its own average turnover rate which can be estimatod roughly, it is difficult to estimete a rato which can accurately be applied to raw materials, goods in process and finished goods. Moreover, all firms within a given industry do not value inventories on the same basis, the most comenon methods being lower of cost or market and standard cost. These considerations make it difficult to determine the length of time necessary before a change in wholesale prices will be reflected in inventory values. Added to this is the fact that the wholesale price index and the index of inventory values are compiled differently. The wholesale price index is computed from selling pricee, and weighted according to quantities sold; while, as noted above, most firms report inventories at some variation of cost and the index is automatically woighted according to quantities held.
