

INVENTORIES \& SHIPMENTS BY MANUFACTURING INDUSTRIES

MARCH, 1951

# DOMINION BUREAU OF STATISTICS 

## Department of Trade and Commerce

Published by
Authority of the Rt. Hon. C. D. Howe, Minister of Trade and Commerce

## Prepared in the

Commodity Statistics Section of the Industry and Merchandising Division, Dominion Bureau of Statistics, Ottawa

This report continues the monthly series of indexes of the dollar value of manufacturers' inventories and shipments. The breakdown of material presented is as follows:
(1) Indexes of the estimated total value of inventory held in all industries and in groupings of industries classified according to the economic use made of their products, by months for the period January 1949 to March 1951. The estimated totals are based on data collected from samples in industries holding approximately 92 p.c. of all manufacturing inventories. Indexes of shipments for the same groupings are included where available, although no estimate of total shipments for all industries is made. Indexes are based on the average 1947 values in each case. March figures are preliminary only.
(2) Indexes of the value of shipments and inventories, broken down into raw materials, goods in process, and finished goods for totals of reporting firms in individual industries. The base for these indexes is also the average 1947 values reported in each case. Data for individual industries include the index numbers for the current month, the previous month, and the same month a year ago.

All industry groupings shown are in accordance with the definitions given in the Standard Industrial Classification manual. This classification was adopted with the December, 1949 report. Historical data from January 1947 for individual industries in Table 2 may be obtained on request.

Seven additional industries have recently been included with those shown in detail in Table 2. These are Flour Milling, Brewing, Sugar Refining, Cement and Cement Products, Leather Tanneries, Dairy Products and Petroleum Products. Until recently, these industries were part of the second group described on page 3 , where estimated of total inventory were based on data available on the physical volume of the chief types of stocks held. Actual value data is now, however, submitted each month by a large sample of firms in each of these industries, and detailed indexes can, therefore, be shown. It is expected that the majority of industries in which inventory values are still arrived at by valuation of physical stocks will be brought into the regular sample series within the present year. It will be observed that, where the new industries are shown separately in Table 1 , the indexes differ somewhat from those shown for total inventory in Table 2, although the trends are the same. It has been thought advisable not to make revisions to allow for these differences of level in Table 1 as each industry is added; when all industries have been included on a sample basis, the historical series will be revised in total.

Preliminary reports indicate the following trends in inventory holdings at the end of March:

All index numbers quoted in this commentary and contained in the tables that follow are based on the corresponding average 1947 values. It also should be pointed out that this survey only permits classification of an industry under the Heading best suited to the chief commodity produced by that industry. It follows, therefore, since many industries produce more than the one commodity or commodity group which governs their classification, that the figures shown apply to all commodities produced by reporting firms and, consequently, the index numbers are descriptive of the behaviour of industries only and should not be construed as a measure of commodity movement.

Preliminary reports for March indicate an index of 156.6 per cent of the average 1947 value, 3.2 points above the preceding month of February 1951, and 21.8 points above the March 1950 level. The gain over the previous month continued the rapid increase which began last November, and was shared by each major industry goup to some extent.

The Consumers' Goods industries rose by 3.8 points over the previous high of 161.9 in February. The Capital Goods industries increased 3.6 points to reach an index of 121.9 , which is the highest point for this component since March 1949. The Producers' Goods industries increased slightly in Total to 142.2 , approximately equal to the peak reached by this component in July 1949. The Construction Goods industries reached a new high in March with an increase of 4.6 points and an index of 191.7; figures for Sawmills the largest component in this group, are however, preliminary estimates only.

In the Consumers' Goods industries, the Non-Durable Finished Goods component rose by 2.6 points. The Food Industries and the Tobacco and Liquor industries recorded gains of 2,4 points and 3.6 points respectively, while Petroleum Products declined 3.3 points. The Non-Durable Semi-Finished Goods index declined 2.4 points, due mainly to a seasonal decline in the Flour and Feeds industry of 26.6 points. The general index of Non-Durable Goods moved from a February index of 161.1 to 162.8 in March. The Semi-Durable group of industries had an increase of 5.4 points, the largest gains in this classification being 14.4 points in the woollen and Worsted Yarn industry and 14.0 points in the Rubber Goods industry. The index of Durable Consumers' Goods industries advanced to 174.0 in March, compared to 166.2 in February, the most noteworthy gains having occurred in the Bicycles and Miscellaneous Transportation Equipment industry, 39.2 points, and the Miscellaneous Iron and Steel industry, 19.3 points.

In the Capital Goods group the Transportation Equipment industries increased their holdings slightly in March, although the index at 71.7 still remains well below the 1947 average level. The index for All Other Capital Goods industries rose 5.3 points, to a March index of 150.7 ; the largest gains of 7.8 points and 10.7 points respectively were recorded in the Machinery and Borders Tanks and Platework industries.

In the Producers Materials industries, no significant changes took place in the larger industry groups, but among the smaller industries, Compressed Gases, Cordage, Rope and Twine, and Miscellaneous Non Metallic Mineral Products showed gains of approximately 13 points each. The Coke and Gas Products industry continued its seasonal decline dropping 16.4 points.

The Construction Goods industries again recorded gains over the previous month and the index now stands at 191.7 for March, an advance of 3.2 points. The industries affected most by this advance were Fabricated and Structural Steel, Clay Products and Sawmills with gains of 12.5 points, 10.4 points and 5.2 points respectively.

In the survey of Shipments practically all the industries covered reported increases in March as compared with the previous month, and substantial increases over the same month last year. The most noteworthy changes from the February indexes occurred in the Jewellery and Silverware industry, the Cen ent and Cement Products industry and the Brewing industry where gains of 109 points, 50 points and 50 points respectively were recorded. Declines were recorded in the Soaps and Washing Compounds industry and the Fertilizers industry of 38 and 30 points respectively.
Material for this report was prepared under the supervision of Miss B. Mercer, of the Commodity Section, Industry and Merchandising Division.

## SECTION 1

## MONTHLY INDEXES OF ESTIMATED TOTAL VALUE OF INVENTORY

BY ECONOMIC USE GROUPINGS OF INDUSTRIES

The following tables show indexes, based on the 1947 Value of the estimated total value of inventory in Canada, by months.

The estimates have been based on two types of source materials. In most industries totals were estimated from data submitted by a sample of leading firms which report the value of their inventories and shipments monthly. Though the size of the sample varies to some extent from industry to industry, in most cases the firms reporting hold over half of all the inventories held in the industry and in a number of instances the sample includes more than 90 per cent of the total. In a smaller group of industries estimates have been based on information available on the physical volume of the chief types of stocks held in these industries. By use of data on prices and on the rate at which these stocks turn over, an estimate of the current value of these inventories has been made. Because no information is available on the accounting methods used by the firms in these industries the value of inventories shown for them cannot be expected to correspond exactly to their own book value but it does show the general trend on inventories in these industries and makes it possible to build up an overall picture for the manufacturing field. All industry groupings are defined according to the Standard Classification Manual (see page l).

The total in Table 1 has been presented in detail according to an economic use classification. In this classification goods have been grouped according to whether production consists primarily of consumer goods, capital goods producers' materials or construction materials. This form of presentation corresponds to the type of use which is ultimately made of the goods produced by various industries. Because some industries produce goods which fall in more than one of these main groups, the classification can only be approximate in nature and in allocating certain industries fairly arbitrary decisions had to be made. In time some further groupings of plants within industries should make it possible to improve the accuracy of this presentation.

Within the consumer goods group a further subdivision has been shown on the basis of whether the product is primarily of a perishable, a semi-durable, or a durable nature. This form of presentation has been widely used in recent years and corresponds to the form in which consumer expenditures, part of the country's gross national expenditure is presented. This should be useful to all those who are interested in the general flow of goods from the primary producing stage to their ultimate destination.

## SECTION II

## MONTHLY INDEXES OF INVENTORIES AND SHIPMENTS OF REPORTING FIRMS, BY INDUSTRIES

Data available from the monthly sample survey of shipments and inventories of manufacturing industries are incorporated, insofar as total inventories are concerned into Table I, but it has been thought advisable to show further detail for individual industries wherever possible. Since this is a sample survey, covering only selected firms in a special group of industries, the dollar values actually reported by the firms have been converted into index numbers representative of industries, or groups of industries, the base being the average 1947 values reported. The index presentation avoids the possibility that dollar value totals for reporting firms might be mistaken for dollar value totals for industries.

A number of individual industry groups shown in this section were revised, beginning with the December report, to allow for final Standard Classification changes. Since the number of firms involved in each re-grouping was relatively small, the industry trends on the new basis do not differ substantially from previously published data, and historical series have not, therefore, been published. Completely revised series for any groups are, however, available on request.

When considering the series presented in table 2 it must be borne in mind that the divisions are industry divisions, and not commodities. For example, the Wool C loth Industry does not represent the shipments and inventories of Wool Cloth only, but all commodities involved in the activities of firms whose major product is Wool C loth.

Also, it must be emphasized most particularly that the index numbers shown in this series are based on the dollar values of inventories held, not on actual physical quantities. Apart from the fact that dollar values are required by economists interested in investment in inventory, it is obvious that the value approach is the only practical one, considering the wide range of commodities held by manufacturers in all stages from raw materials to finished products ready for sale. However, the value of commodities in stock is the result not only of raw material costs, but also of the cost of making them. Thus, if prices or labour costs rise the value of the goods held increases, even though the quantity may remain the same. Therefore, changes shown from month to month by the index numbers represent not only quantity changes but also the changes in the value of each item included. The only indication of the extent to which values of items have changed is the trends shown by the indexes of prices \& labour costs published in the "Canadian Statistical Review"

The Bureau is at present attempting to devise a means of deflating the inventory series in order that quantity changes may be reflected more accurately. For those interested in this problem, some of the factors which must be taken into consideration may be noted. While each industry has its own average turnover rate which can be estimated roughly, it is difficult to estimate a rate which can accurately be applied to raw materials, goods in process and finished goods. Moreover, all firms within a given industry do not value inventories on the same basis, the most common methods being lower of cost or market and standard cost. These considerations make it difficult to determine the length of time necessary before a change in wholesale prices will be reflected in inventory values. Added to this is the fact that the wholesale price index and the index of inventory values are compiled differently. The wholesale price index is computed from selling prices, and weighted according to quantities sold: while, as noted above, most firms report inventories at some variation of cost and the index is automatically weighted according to quantities held.
