# DOMINION BUREAU OF STATISTICS 

## Department of Trade and Commerce

Published by<br>Authority of the Rt. Hon. C. D. Howe<br>Minister of Trade and Commerce

Prepared in the Commodity Statistics Section of the Industry and Merchandising Division

Dominion Bureau of Statistics
Ottawa

This report contains monthly data on the value of manafacturers' inventories and shipments. The breakdown of material presented is as follows: TREND SUMMARY page 1
ESTIMATED INVENTORY VALUES Table 1, page 3:
the period January 1950 to November into raw materials, goods in process, and finished products up to October 1952 are included. Similar tables are shown for four major groupings, in which all industries have been classified according to the economic use made of their products, into consumers' goods industries, producers' goods industries, capital goods industries, and construction goods industries. November values are preliminary.
TOTAL INVENTORY AND
SHIPMENTS INDEXES
Table 11, page 8: of industries, by month for the period based on the average and on the average 1947 values in each case. November figures are preliminary. INDIVIDUAL INDUSTRY INDEXES Indexes of the value of shipments and invenTable 111, page 18: in process, and finished products for total of reporting firms in individual industries. The base for these indexes is also the average 1947 values reported in each case. Data for individual industries include indexes for the current month (preliminary), the previous month, and the same month a year ago.
OUTSTANDING ORDERS Indexes of outstanding orders at the end of Table IV, page 28: the month, for September, October, and November as reported by over 900 plants in 65 industries. Indexes of shipments for the same firms are included for September and October. The number of current month's shipments values represented by unfilled orders at the end of the month is also given for September and October. November indexes of orders are preliminary. SOURCES AND METHODS page 31

A brief description of the sources on which used, and factors to be noted in using the values and indexes presented. Material in Tables 1 and 11 was completely revised for the December, 1951 repart.

## Trend Summary

Preliminary reports indicate the following trends in Manufacturers' inventories and shipments at the end of November:

Continuing the gradual but almost steady decline since the end of 1951, the estimated total value of inventory held by manufacturers at the end of November dropped to $\$ 3,421$ million, down $\$ 8$ million from the October level and 3 per cent under the preceding year's November total of $\$ 3,520$ million. In index terms the November level was 183.8 per cent of the average 1947 value, compared with 184.2 for the previous month and 189.1 for the same month a year ago. Shipments values in total showed a decrease of 7 per cent over October 1952 values but were 2 per cent higher than the same month a year ago. The cumulative shipments total for the first 11 months of 1952 was 2.5 per cent above the total for the same period in 1951.

The Consumers' Goods industries showed a slight increase of one million in inventory values during November; the total being now $\$ 1,959$ million. This is $\$ 218$ million lower than the post-war-peak for this group, reached in October 1951. In index terms, the November level was 174.7 (average $1947=100$ ) compared with 174.6 for the previous month, 190.9 for the same month a year earlier and 194.2 for the October 1951 peak. Shipments for the same group showed a sharp decline of 8 per cent, the index being 167.5 for November as against 181.8 for the previous
month and 165.8 for November last year. Cumulative shipments to the end of November in this sector were approximately the same as they were for the same period last year.

The Non-Durable Consumers' Goods industries had an increase in inventory of 2 per cent, the index moving up from 188.1 to 191.8 . This was accounted for chiefly by the Slaughtering and Meat Packing, Sugar Refinery, Petroleum Products and Flour Milling industries with increases varying from 9 to 22 per cent, the other industries in the group remaining fairly stable. The index of shipments decreased from 179.6 to 171.5 , or 4.5 per cent, with the industries mentioned above showing the largest declines, with the exception of the Slaughtering and Meat Packing industry.

In the Semi-Durable Consumers' Goods industries, the inventory index fell from 149.8 to 143.5 continuing the steady and gradual decline since July 1951 when the index had reached a post-war peak of 197.4. This was caused mainly by the Textile and the Clothing industry groups. Shipments also fell approximately 12 per cent, the index dropping to 146.3 from 165.3 . This decline was accounted for by the Clothing industry group, the largest component, with an index of 149.4 for November as compared with 183.4 for October, a decline of 19 per cent.

In the Durable Consumers' Goods industries the value of inventories remained at about the same level as in October, the index moving down from 175.7 to 175.5 . Shipments however dropped 14.5 per cent, the November index being 188.4. This decrease came chiefly from the Motor Vehicle and the Furniture industries, the two largest components of the group, with a decline of 18 and 9 per cent respectively.

In the Capital Goods Industries, November inventory values at $\$ 509$ million were $\$ 12$ million below October values. The Shipbuilding industry had a drop of 23 per cent, while the Agricultural Implements industry increased its holdings by 4 per cent. All the other industries of the group remained at approximately the same level. Shipments in this sector were down very slightly. Although there was an increase of 16 per cent in the total transportation equipment group, this was compensated by a decrease in all the remaining industries, with the exception of the Boilers, Tanks and Plate Work industry which increased 15 per cent. Cumulative shipments for this group were 17 per cent above 1951 for the same period.

The Producers' goods industries had inventory values at the end of November of $\$ 692$ million, an increase of $\$ 12$ million over the preceding month. In index terms, the November level was 201.9, a post-war peak for this group, to compare with an index of 198.6 for October. The Primary Iron \& Steel industry and the Sheet Metal Products industry showed increases of 5 and 14 per cent respectively. Shipments decreased 2.5 per cent, the November index being 184.6. The Primary Iron \& Steel and the Sheet Metal Products industries had decline of 7 and 20 per cent respectively. Cumulative shipments values for the first eleven months of the year were 3.6 per cent above the 1951 values for the same period.

In the Construction Goods industries, the estimated total value of inventories at the end of November was $\$ 261$ million, $\$ 8$ million below the October level, the index being 214.6 as compared with 221.2 at the end of the previous month. The Sawmills industry, the largest of the groups, showed a decline of 8 per cent for preliminary estimates, while the Fabricated and Structural Steel Industry had an increase of 12 per cent. Shipments were down $2 l$ per cent due to a seasonal decline in all large industries in the group. Cumulative shipments for this sector were above the 1951 level for the same period by 1.7 per cent.

## Monthly Report on Manufacturers' Inventories, Silipments and Orders - November, 1952

## Table 4. - Outstanding Orders at End of Month

Note - The following table represents indexes of value of shipments during the month and total outstanding orders at the end of the month, and the ratio of outstanding orders to shipments (number of current month's shipments value represented by outstanding orders) as reported by 900 manufacturing plants in the Monthly Inventory Survey. These plants accounted for approximately 28 percent of total production value in 1950. The data have been grouped according to the Standard Industrial Classification, as well as into larger significant groupings; the larger groupings represent reporting firms only, with no industry weightings. The base for the indexes is January 1952.

Coverage in the individual industries shown varies from 20 to 94 percent of total production valus in these industries. Group totals include firms in appropriate industries which are not shown separately due to insufficient coverage. The industry coverage is not as extensive as in Tables 2 and 3 because, in many industries, backlogs of orders are negligible. Within industries included, the coverage of firms is smaller than in Table 3 because a number of firms do not keop value records of unfilled orders. Separate shipments inderes for firms reporting orders have, therefore, been compiled, thus giving comparable data.
"Outstanding Orders" are defined as total backlogs of orders on books at end of month, irrespective of work done on them or of stocks from which they can be filled. In industries where long-term projects are common, this concept is not as satisfactory as is "work still to be done on orders". It is expected that a series covering the latter, in selocted industries, will be available within the next few months.

(1) Orders for this industry represent a two-month sales forecast, not total outstanding orders. Data for the industry are not included in any of the groupings on page 28.

## MONTHLY REPORT ON MANUFACTURERS INVENTORIES, SHIPMENTS AND ORDERS, NOVEMBER, 1952

## SOURCES AND METHODS

Sources: The tables contained in this report have been compiled from three types of material. In 96 industries, which in 1950 accounted for $73 \%$ of total gross value of production and $79 \%$ of total manufacturers' inventories, values of inventories and shipments are reported monthly by a sample of leading firms. Though the size of the sample varies from industry to industry, the average share of total inventory in the industries thus covered held by reporting firm is $72 \%$. In one large industry, monthly reports on shipments and inventories are made by a stratum sample of firms. In 5 industries, information is available on the physical volume of the chief types of stocks held by all or a representative sample of firms. Estimates of the current value of these stocks are made by means of data on prices or labour costs and rates of turnover in each industry. For three of these industries, shipments are calculated from production and inventory data. In total, these three groups hold $92 \%$ of all manufacturing inventories, and account for $87 \%$ of total gross value of production in Canada.

Methods: Individual indexes for each industry covered in the monthly survey are derived from the values reported by the sample of firms described above and based on the values reported by corresponding firms in December, 1946 adjusted to the average 1947 value. Since the industry indexes are designed to give a comparable historical series for reporting firms, no adjustment has been made to the individual industry indexes in Table III or to the industry-group indexes in Table II to allow for differences in the annual inventory change as shown in these series and in the complete Annual Survey (See December, 1951 report).

Inventory values for all-industry totals are obtained by applying the sample industry indexes for total inventory for each December to the corresponding December total inventory values for the same industries (as obtained from the annual surveys described above) and projecting from the last December for the intervening month's. The small percentage of inventory held by industries not covered in the monthly survey is allowed for by projecting the latest December values for these industries on the trends shown by reporting industries in the same field. (1949 values were projected backward from December 1949 rather than forward from December 1948, because annual inventory data, prior to 1949 was compiled under the old industrial classification, and the industry totals for previous years do not, therefore correspond exactly with the groupings used in the sample series). The projection of December values has the effect of reweighting the sample once a year, thus correcting sampling errors. All-industry totals in Table 1 are therefore not strictly comparable from year to year (with the exception of 1949-50), and to indicate the extent of incomparability, both the estimated and actual December values are shown in the table (actual values are in brackets).

The breakdown of total inventory into main components - raw material, goods in process, and finished products - was derived by using the monthly component ratio for each sample industry against the projected total inventory value for the corresponding industry. Trends of reporting industries were again used to allow for industries not covered in the survey. This method was adopted because the alternative - applying the December, 1949 component indexes to the December, 1949 component values for each industry and projecting as for total inventory required that the industry samples should be based on component, as well as total
coverage. The present samples are based on total coverage only. Beause the method is based on reporting firms only, the component totals do not correspond exactly with similar values obtained in the complete Annual Surveys.

Group totals for shipments were compiled by weighting the various industry indexes by their 1949 gross values of production, since no complete survey of shipments is available.

Factors to be noted in using the material presented in this report. When considering the individual industry series presented, it must be borne in mind that the divisions are industry divisions, not commodities. Industries and firms are classified according to the chief commodity produced, but since many firms produce more than the one commodity or commodity group which governs their classification, it follows that the figures shown apply to all commodities produced by reporting firms. The index numbers are, therefore, descriptive of the behaviour of industries only and should not be construed as a measure of commodity movement.

Also, it must be emphasized that the index numbers shown in this series are based on the dollar values of inventories held, not on actual physical quantities. Apart from the fact that dollar values are required by economists interested in investment in inventory, it is obvious that the value approach is the only practical one, considering the wide range of commodities held by manufacturers in all stages from raw materials to finished products ready for sale. However, the value of commodities in stock is the result not only of raw material costs, but also of the cost of making them. Thus, if prices or labour costs rise, the value of the goods held increases, even though the quantity may remain the same. Therefore, changes shown from month to month by the index numbers represent not only quantity changes, but also the changes in the value of each item included.

Factors involved in separating physical changes from value changes for inventories: Some indication of the extent to which changes in value of inventories are due to changes in prices (both of goods and labour), thus isolating the physical changes which has taken place, can be obtained by reference to the trend in price changes as shown in the index of wholesale prices published in the "Canadian Statistical Review'. This method should, however, be used with caution. While each industry has its own average turnover rate which can be estimated roughly, it is difficult to estimate a rate which can accurately be applied to raw materials, goods in process and finished goods. Moreover, all firms within a given industry do not value inventories on the same basis, the most common methods being lower of cost or market and standard cost. These considerations make it difficult to determine the length of time necessary before a change in wholesale prices will be reflected in inventory values. Added to this is the fact that the wholesale price index and the index of inventory values are compiled differently. The wholesale price index is computed from selling prices, and weighted according to quantities sold; while, as noted above, most firms report inventories at some variation of cost and the index is automatically weighted according to quantities held.

An adequate deflating technique would require knowledge of inventory content commodity price indexes, turnover rates and accounting methods on a detailed industry basis. Since such data are not available, estimates of physical change involved in total inventory have been made, based on changes in the wholesale price index and in average hourly earnings, and on estimated turnover rates. These are discussed in the Trend Summary on page 1 . They are presented as a
matter of interest, but in view of the difficulties discussed above, must be considered as approximations only.

Historical Data: All individual industry inventory and shipments series, on a monthTy basis, are available from January, 1947 to date, and may be obtained on request. In each case, data from comparable groupings of firms, on the Standard Industrial Classification basis, have been compiled for the entire period. Since, prior to 1949, these groupings do not correspond to annual inventory and production data which were at that time on the old classification system, estimates of total inventory have been carried back to January, 1949 only.

## Note Table 1

(1) This series has been revised from December, 1950 to allow for final figures, and for reweighting, from the 1950 Year-End Survey. Bracketed December 1950 figures indicate a breakdown on the basis of this revision, and are, therefore, comparable with the 1951 data.
