

# INVENTORIES, SHIPMENTS \& ORDERS IN MANUFACTURING INDUSTRIES 

MARCH, 1952

# DOMINION BUREAU OF STATISTICS <br> Department of Trade and Commerce 

Published by
Authority of the Rt. Hon. C. D. Howe, Minister of Trade and Commerce

## Prepared in the

Commodity Statistics Section of the Industry and Merchandising Division, Dominion Bureau of Statistics, Ottawa

This report contains monthly data on the value of manufacturers' inventories and shipments. The breakdown of material presented is as follows:

## TREND SUMMARY

 page 1ESTIMATED INVENTORY VALUES Table 1, page 3:
for the period January 1950 to March 1952. Values for total inventory subdivided into raw materials, goods in process, and finished products up to February 1951 are included. Similar tables are shown for four major groupings, in which all industries have been classified according to the economic use made of their products, into consumers ${ }^{\text {t }}$ goods industries, producers ${ }^{3}$ goods industries, capital goods industries, and construction goods industries. March values are preliminary. TOTAL INVENTORY AND Indexes of the estimated total value of inSHIPMENTS INDEXES ventory and shipments in all industries, Table II, page 8 : dexes are based on the average 1947 values in each case. March figures are preliminary.
INDIVIDUAL INDUSTRY INDEXES Table III page 18: ventories, broken down into raw materials, goods in process, and finished products, for total of reporting firms in individual industries. The base for these indexes is also the average 1947 values reported in each case. Data for individual industries include indexes for the current month (preliminary), the previous month, and the same month a year ago. OUTSTANDING ORDERS Indexes of outstanding orders at the end of Table IV, page 28: the month, for February and March, as reported by over 900 plants in 65 industries. Indexes of shipments for the same firms are included. The number of current month's shipments values represented by unfilled orders at the end of the month is given for January and February and March indexes are preliminary.
SOURCES AND METHODS A brief description of the sources on which page 31 the material is based, methods of estimation used, and factors to be noted in using the values and indexes presented.

Material in Tables I and II was completely revised for December, 1951 report.

## TREND SUMMARY

Preliminary reports indicate the following trends in Manufacturers' inventories and shipments at the end of March.

Estimates of total inventory Talue showed a small increase after a decline for two consecutive months, the level at the end of March being $\$ 3.539 .4$ million. This was an increase of $\$ 7$ million, or 0.2 percent, from the revised February estimate, but was $\$ 583$ million, or 19.7 percent above the level at the end of March, 1951. In index terms the March level was 190.2 percent of the average 1947 values, as compared with 189.8 at the end of February and 158.8 a year earlier. The index for total shipments during the month was 175.1 , an increase of 4.8 percent over the February figures. Cumulative shipments for the first quarter of the year were 3.2 percent above the same period in 1951.

The Consumers' Goods industries, in which there was a considerable decline from January to February, now showed a slight inventory increase of $\$ 4.3$ million and also a more substantial increase in shipments of 3.2 percent over February. The Non-Durable Goods components increased 4,5 from the February index of 187.1. This increase was accounted for by the Pulp and Paper and the Feed and Flour industries, which showed a rise in inventory of 9.2 points and 6.2 points respectively. The Flour and Feed industry also had an increase in sales of 17.7
points from the February index of 122.8. In the Semi-Durable Goods industries the Clothing, Leather Footwear, Textiles and Leather Tanneries industries had a large decrease in inventory, due mainly to larger shipments except for the Leather Tanneries industry. In the Durable Consumers' Goods industries, the Motor Vehicle industry showed an increase in inventory of 7.3 points over February to reach a high of 217.3 points, 22.1 per cent over March last year. Seasonal changes accounted for 6.4 per cent increase in shipments over February in this industry.

In the Capital Goods industries, inventories increased by almost $\$ 16$ million, or 3 per cent, while shipments increased by 11 per cent. Changes in inventory while noticeable in the Shipbuilding, Railway Rolling Stock and Machinery industries, were more important in the Aircraft and Boilers and Plate Work industries where the increases were 13.4 per cent, and 16.6 per cent, respectively. Shipments in the Shipbuilding, Aircraft, and Boilers and Plate Work industries rose sharply. However, it must be stressed that specific industries in the Capital Goods group, i. e., Shipbuilding, Aircraft, etc., are heavily engaged on long term commitments, and that inventory changes may be largely related to incomplete work done in connection with such commitments. Similarly, shipments can reflect transfer of ownership by other means than actual sales or shipments, due to the fact that progress payments are treated as sales when they reflect work done.

The Producers' Goods industries showed a one per cent decline in inventory and a two per cent decline in shipments values. The inventory decrease came chiefly from the Acids, Alkalies and Salts industries, and a large seasonal decline in the Coke and Gas Products industries. Shipments were up slightly in the Ir on and Steel Group, and were down in the Non-Ferrous Metals and Coke and Gas industries.

In the Construction Goods group, inventories declined almost three per cent and shipments rose 20.4 per cent. This is due mainly to a seasonal increase in shipments. The chief gain in shipments was shown in Sawmills, the largest component of this group, where preliminary estimates indicate an increase of 21.2 per cent.

Estimates of inventory value by components, available to the end of February showed a decrease of $\$ 43$ million from January levels in Raw Materials, and a decrease of $\$ 16.7$ million in Goods in Process from the same levels, while Finished Products rose to the second highest level in the past two years. Raw Materials had a decline in the Consumers' Goods industries of $\$ 64.4$ million and increases of $\$ 16.2$ million in the Construction Goods industries and $\$ 9.3$ million in the Capital Goods industries. Goods in Process showed no important changes, except in the Construction Goods industries where there is a drop of $\$ 15.5$ million, but their Finished Products on the other hand showed an increase of $\$ 4.2$ million, and their shipments, an increase of 20 per cent.

A compilation of total outstanding orders (as defined on page 28, para. 3) at the end of February for approximately 1,000 plants in 65 different industries showed a level of unfilled orders equal to 5.7 times the January shipments values for reporting firms, a slight decrease from January figures. Preliminary Outstanding Orders index at the end of March was 2.3 per cent lower than in February. These data are presented in a new series given on page 28 , where indexes of shipments and unfilled orders in February and March for a number of large individual industries are also shown.

For detail on trends in individual industries, reference should be made to the tables following.

| March | 1952 | 153.5 | 141.7 | 125.7 | 97.0 | 215.4 |

## Table 4. - Cutstanding Orders at End of Month

Note = The following table represents indexes of value of shipments during the month and total outstanding orders at the end of the month, and the ratio of outstanding orders to shipments (number of current month's shipments value represented by outstanding orders) as reported by 900 manufacturing plants in the Montaly Inventory Survey. These plants accounted for approximatsly 23 percent of total production vatue in 1950. The data have been erouped according to the Standard Industrial Classification, as well as into larger significant groupings; the larger groupings represent reporting firms only, with no industry weightings. The base for the indexes is January, 1952.

Coverage in the individual industries shown varies from 20 to 94 percent of total production value in these industries. Group totals include firms in appropriate industries which are not shown separately due to insufficient coverage. The industry coverage is not as extensive as in Tables 2 and 3 because, in many industries, backlogs of orders are neglegiblo. Within industries included, the coverage of firms is smaller than in Table 3 because a number of firms do not keep value records of unfilled orders. Separate shipments indexes for firms reporting orders have, therefore, been compiled, thus giving comparable data.
"Outstanding Crders" are defined as total backlogs of orders on books at end of month, frrespective of work done on them or of stocks from which they can be filled. In industries where long-term projects are common, this concept, is not as satisfactory as is "work still to be done on orders". It is expected that a series covering the latter, in selected industries, will be available within the next few months.

(1) Including Foods, Leather, Footwear, Clothing, Furniture, Electrical Appliances, Soaps, Brooms and Brushes, Musical Instruments.
(2) Excluding Motor Vehicles.

(1) Orders for this industry represcnt a twomonth sales forecast, not total outstanding orders. Data for the industry are not included in any of the groupings on page 28.

## MONTHLY REPORT ON INVENTORIES AND SHIPMENTS OF MANUFACTURING INDUSTRIES, MARCH 1952

## SOURCES AND METHODS

Sources: The tables contained in this report have been compiled from three types of material. In 96 industries, which in 1950 accounted for $73 \%$ of total gross value of production and $79 \%$ of total manufacturers' inventories, values of inventories and shipments are reported monthly by a sample of leading firms. Though the size of the sample varies from industry to industry, the average share of total inventory in the industries thus covered held by reporting firms is $72 \%$. In one large industry, monthly reports on shipments and inventories are made by a stratum sample of firms. In 5 industries, information is available on the physical volume of the chief types of stocks held by all, or a representative sample of firms. Estimates of the current value of these stocks are made by means of data on prices or labour costs and rates of turnover in each industry. For three of these industries, shipments are calculated from production and inventory data. In total, these three groups hold $92 \%$ of all manufacturing inventories, and account for $87 \%$ of total gross value of production in Canada.

Methods: Individual indexes for each industry covered in the monthly survey are derived from the values reported by the sample of firms described above and based on the values reported by corresponding firms in December, 1946 adjusted to the average 1947 value. Since the industry indexes are designed to give a comparable historical series for reporting firms, no adjustment has been made to the individual industry indexes in Table III or to the industry-group indexes in Table II to allow for differences in the annual inventory change as shown in these series and in the complete Annual Survey (See December, 1951 report).

Inventory values for all-industry totals are obtained by applying the sample industry indexes for total inventory for each December to the corresponding December total inventory values for the same industries (as obtained from the annual surveys described above) and projecting from the last December for the intervening month's. The small percentage of inventory held by industries not covered in the monthly survey is allowed for by projecting the latest December values for these industries on the trends shown by reporting industries in the same field。 (1949 values were projected backward from December 1949 rather than forward from December 1948 , because annual inventory data, prior to 1949 was compiled under the old industrial classification, and the industry totals for previous years do not, therefore correspond exactly with the groupings used in the sample series). The projection of December values has the effect of reweighting the sample once a year, thus correcting sampling errors. All-industry totals in Table lare therefore not strictly comparable from year to year (with the exception of 1949-50), and to indicate the extent of incomparability, both the estimated and actual December values are shown in the table (actual values are in brackets).

The breakdown of total inventory into main components - raw material, goods in process, and finished products - was derived by using the monthly component ratio for each sample industry against the projected total inventory value for the corresponding industry. Trends of reporting industries were again used to allow for industries not covered in the survey. This method was adopted because the alternative - applying the December, 1949 component indexes to the December, 1949 component values for each industry and projecting as for total inventory required that the industry samples should be based on component, as well as
total coverage. The present samples are based on total coverage only. Because the method is based on reporting firms only, the component totals do not correspond exactly with similar values obtained in the complete Annual Surveys.

Group totals for shipments were compiled by weighting the various industry indexes by their 1949 gross values of production, since no complete survey of shipments is available.

Factors to be noted in using the material presented in this report. When considering the individual industry series presented, it must be borne in mind that the divisions are industry divisions, not commodities. Industries and firms are classified according to the chief commodity produced, but since many firms produce more than the one commodity or commodity group which governs their classification, it follows that the figures shown apply to all commodities produced by reporting firms. The index numbers are, therefore, descriptive of the behaviour of industries only and should not be construed as a measure of commodity movement.

Also, it must be emphasized that the index numbers shown in this series are based on the dollar values of inventories held, not on actual physical quantities. Apart from the fact that dollar values are required by economists interested in investment in inventory, it is obvious that the value approach is the only practical one, considering the wide range of commodities held by manufacturers in all stages from raw materials to finished products ready for sale. However, the value of commodities in stock is the result not only of raw material costs, but also of the cost of making them. Thus, if prices or labour costs rise, the value of the goods held increases, even though the quantity may remain the same. Therefore, changes shown from month to month by the index numbers represent not only quantity changes, but also the changes in the value of each itemincluded.

Factors involved in separating physical changes from value changes for inventories: Some indication of the extent to which changes in value of inventories are due to changes in prices (both of goods and labour), thus isolating the physical change which has taken place, can be obtained by reference to the trend in price changes as shown in the index of wholesale prices published in the "Canadian Statistical Review". This method should, however, be used with caution. While each industry has its own average turnover rate which can be estimated roughly, it is difficult to estimate a rate which can accurately be applied to raw materials, goods in process and finished goods. Moreover, all firms within a given industry do not value inventories on the same basis, the most common methods being lower of cost or market and standard cost. These considerations make it difficult to determine the length of time necessary before a change in wholesale prices will be reflected in inventory values. Added to this is the fact that the wholesale price index and the index of inventory values are compiled differently. The wholesale price index is computed from selling prices, and weighted according to quantities sold; while, as noted above, most firms report inventories at some variation of cost and the index is automatically weighted according to quantities held.

An adequate deflating technique would require knowledge of inventory content commodity price indexes, turnover rates and accounting methods on a detailed industry basis. Since such data are not yet available, estimates of physical change involved in total inventory have been made, based on changes in the wholesale price index and in average hourly earnings, and on estimated turnover rates. These are discussed in the Trend Summary on page 1 . They are presented as a matter of interest, but in view of the difficulties discussed above, must be considered as approximations only.

Historical Data: All individual industry inventory and shipments series, on a monthly basis, are available from January, 1947 to date, and may be obtained on request. In each case, data from comparable groupings of firms, on the Standard Industrial Classification basis, have been compiled for the entire period. Since, prior to 1949 , these groupings do not correspond to annual inventory and production data which were at that time on the old classification system, estimates of total inventory have been carried back to January, 1949 only.

Note Table I
(1) This series has been revised from December, 1950 to allow for final figures, and for reweighting, from the 1950 Y ear-End Survey. Bracketed December 1950 figures indicate a breakdown on the basis of this revision, and are, therefore, comparable with the 1951 data.
