DEPARTMENT OF TRADE AND COMMERCE DOMINION BUREAU OF STATISTICS MINING, METALLURGICAL AND CHEMICAL BRANCH OTTAWA - CANADA

Dominion Statistician: R. H. Coats, LL.D., F.R.S.C., F.S.S. (Hon.) Chief - Mining, Metallurgical and Chemical Branch: W. H. Losee, B. Sc. Mining Statistician: R. J. McDowall, B. Sc.

THE NON-FERROUS SMELTING AND REFINING INDUSTRY IN CANADA, 1936.

Finally revised statistical data relating to operations conducted by the non-ferrous metallurgical industries in Canada during 1936 distinctly reflect the recent and large increase in the production of refined non-ferrous metals and primary metal products in the smelters and refineries of the Dominion.

The gross value of all products totalled \$229,737,420 in 1936 as compared with \$186,245,658 in 1935, or an increase of 23.3 per cent. Refined products included gold, silver, copper, lead, zinc, aluminium, cobalt, cadmium, selenium, tellurium, radium salts, uranium compounds, bismuth and sulphur; other end products of individual plants or companies included copper-nickel matte, cobalt and nickel salts and oxides, arsenious oxide, sulphur in sulphuric acid, platinum metals residues, and blister and anode copper-

The estimated cost of ores, concentrates and other material treated during 1936 was \$137,857,432; fuels and purchased electricity consumed totalled \$12,613,763; chemicals and various other process supplies used amounted to \$7,989,580, and the net value of production or value added by processing was estimated at \$71,276,645, or an increase of 19.9 per cent above that of the preceding year.

Capital employed in 1936 by the combined firms comprising the industry totalled \$143,858,717; 10,015 employees were reported and \$14,346,050 distributed in salaries and wages.

Among the world producers of copper on a smelting and mine basis, Canada ranked third in 1936, being surpassed only by the United States and Chile. Preliminary data for the same year indicate that the Dominion is now the world's fourth largest producer of the metal in the refined state.

Allocated according to origin of ore, Canada, in 1936, was the fourth largest world producer of lead in the form of base bullion, the output of the Canadian industry being exceeded, in the order of their magnitude only by those of the United States, Mexico and Australia.

As a world producer of metallic zinc Canada was credited in 1936 with third position, the United States and Belgium being the two leading nations engaged in the reduction of zinc ores; the Dominion, however, ranks second in world importance as a producer of the metal from domestic ores.

According to the Internal Trade Branch of the Bureau, base metals security prices gained more consistently in 1936 than any other group, rising from 214.8 in January to 241.1 for April (1926=100). Then, after a minor decline to 239.2, they advanced without interruption to 317.8 for December. Spectacular increases in base metal commodity prices, particularly in the final quarter, furnished considerable support for improvement in base metal stock prices. Gains of the latter, however, were approximately three times as great as those for commodity prices.

REVIEW OF THE INDUSTRY BY PROVINCES

QUEBEC - The Aluminium Company of Canada Limited made an important extension to its plant at Arvida; this was for the extraction of alumina from bauxite by the "Bayer" process. In 1936 it was reported that Demerara bauxite from British Guiana is now used at the Arvida plant, the mineral being shipped direct from MacKenzie, British Guiana, to Port Alfred on the Saguenay river; thus the production of aluminium at Arvida is an all-empire enterprise, from mines to finished product. The one plant of the Company located at Arvida was active throughout the year, while aluminium ingot was manufactured at both the Shawinigan Falls and Arvida reduction plants.

During 1936 the Noranda Mines Limited smelter treated 1,120,455 tons of ore, concentrate and refinery slag, and produced 65,376,337 pounds of anodes; after deducting the amount of copper, gold and silver in the refinery slag that was smelted, the estimated production of new copper, gold and silver was 62,750,342 pounds of fine copper, 342,495 ounces of gold and 543,250 ounces of silver. The concentrator milled 1,070,597 tons of ore from the Horne mine, the average analysis of which was 1.86 per cent copper, 0.137 oz. gold per ton and 0.34 oz. silver per ton from which 179,027 tons of concentrate were produced; the cyanide mill treated 149,700 tons of pyrite from the flotation plant tailing, from which 10,016 ounces of gold were recovered. The tonnage of direct smelting ore delivered to the smelter was 483,895 containing 2.82 per cent copper, 0.370 ounces of gold per ton and 0.46 ounces of silver per ton.

Silicious fluxing ore delivered to the smelter totalled 455,438 tons containing 0.46 per cent copper, 0.128 ounces of gold per ton and 0.17 ounces of silver per ton.

Steady operations were maintained throughout 1936 by Canadian Copper Refiners Limited at its electrolytic copper refinery located in Montreal East; production at this plant included electrolytic copper, gold, silver, sellenium and tellurium.

ONTARIO - The International Nickel Company of Canada, Ltd. milled and concentrated 3,317,988 tons of ore in 1936 and the concentrator capacity was enlarged to treat 11,000 tons of ore per day. The Copper Cliff smelter produced 149,000 tons of bessemer matte and 139,796 tons of blister copper. This plant was extended during the year and two reverberatory furnaces and seven converters installed, thus bringing the total smelter equipment to seven reverberatory furnaces and nineteen converters. These additional facilities increase productive capacity by one-third. At the Coniston smelter the four blast furnaces and five converters were operated throughout the year. Ore to the amount of 834,314 tons were processed and 56,827 tons of bessemer matte produced. The nickel refinery of the company, located at Port Colborne, Ontario, operated at capacity throughout the year and produced 103,860,757 pounds of nickel; an addition to this plant, which increased capacity by 50 per cent, was completed during 1936; a small plant was also built for the fabrication of "monel" hot water tanks and range boilers.

The reduction plant of Falconbridge Nickel Mines Ltd, was in operation 332.6 days in 1936; suspension of operations was forced through the failure of power-supply when the Stinson generating station of Hydro was destroyed by fire in September; smelter extensions were completed during the shutdown. During the year 327,783 tons of ore were treated, of which 126,782 tons were milling grade and 201,001 tons for direct smelting. From this were produced 10,244 short tons of matte containing 5,682.5 short tons of nickel and 2,644.4 short tons of copper. Ore treated was reported to contain 1.90 per cent nickel and 0.92 per cent copper.

Adjustments and increases at the smelter embraced the erection of an 18x300 foot reinforced concrete chimney, a new dust chamber and flue system. Sintering capacity was increased, a gas exhausting and dust collecting system installed and a new flue constructed; a new converter was also installed and the blast furnace extended.

Near Goward, in the Temagami Forest Reserve, nickel-copper ores were smelted by Cuniptau Mines Limited and the resultant matte was exported for further treatment in European metallurgical plants.

At Deloro, in Hastings County, the smelter and refinery of the Deloro Smelting and Refining Co. Ltd. was in continuous operation throughout the year. This company treats silver-cobalt ores from Northern Ontario and produces silver bullion, white arsenic, cobalt metal, cobalt salts and oxides, nickel oxide, and a silver-lead-bismuth bullion.

During 1936 the Port Hope radium refinery of Eldorado Gold Mines Ltd. constantly increased its production and the company reports that definite evidence is in hand that the processes now in effect are satisfactory, economical and profitable. With the considerable and rather accelerated increase in production which has been required to meet the demands for radium (present production - March, 1937 - being at the approximate rate of 2.5 grams per month) the facilities at the refinery were soon strained and it has been decided to treble the capacity of the present refinery. November, 1936, witnessed the completion in production of the first ounce of radium. Uranium is also produced from pitchblende at the Port Hope refinery and the company reports that there is a widespread demand for this product in the ceramic industry in which it is utilized in the colouring of glass, pottery and enamelware and for obtaining a satisfactory glaze. In addition to radium and uranium products the company also recovers important quantities of silver.

Blister copper treated in the electrolytic refinery of the Ontario Refining Co. Ltd. at Copper Cliff, Ontario, averaged slightly over 12,000 tons per month and operations were above the rated capacity for the first time. There were several new developments during the year, the most important being the installation of a 30 ton arc type electric melting furnace, and a scheme for transporting molten copper from the Copper Cliff smelter to the refinery, a distance of about one mile. Gold, silver, tellurium, selenium, nickel salts and nickel residues are also produced in this refinery.

MANITOBA AND SASKATCHEWAN - The copper smelter of the Hudson Bay Mining and Smelting Co. Ltd. is located on or adjacent to the inter-provincial boundary between Manitoba and Saskatchewan. It was operated continuously throughout 1936, treating nearly the same tonnage of pay charge as in the preceding year. All but 135 tons of pay charge was from materials produced by the company. Due to the fact that a considerable tonnage of custom copper concentrates is expected to be received during the latter art of 1937, several alterations were made to increase the capacity of the reverberatory furnace, also a fourth copper roaster installation was completed during the fore part of the year. There was smelted in the reverberatory furnace during 1936 a total of 296,877 tons of Flin Flon ore and concentrates averaging 0.393 oz. gold per ton, 5.10 ounces silver per ton and 8.23 per cent copper. There were produced and shipped 22,658 tons of blister copper, with an average assay of gold, 5.004 ounces per ton; silver, 63.48 ounces per ton and copper 98.67 per cent. The average tonnage of new pay material treated per day by the smelter was 812 tons.

There were treated in the cyanide plant a total of 1,073,778 tons of sulphide ore tailings which had an average assay value of gold, 0.0350 ounces per ton and silver, 0.506 ounces per ton; from the treatment of these tailings there were recovered 12,782 ounces gold, 133,105 ounces silver and 53,387 pounds of copper; this material was sent to the copper converters and is included in the blister copper production under the copper smelter.

The electrolytic zinc plant operated continuously throughout the year producing the largest amount of slab zinc to date; the grade of the electrolytic zinc produced was 99.9901 per cent zinc. The production of die casting zinc, which amounted to 2,098 tons, was almost double that of the preceding year. There was treated during the year in the zinc plant a total of 87,137 tons of zinc concentrates averaging 0.059 ounces of gold per ton; 1.77 ounces of silver per ton, 0.77 per cent copper and 45.5 per cent zinc from which was produced for sale a total of 64,437,820 pounds of slab zinc. There was also produced the usual zinc plant residue which was sent to stockpiles.

The complete cadmium plant was finished and a total of 5,413 dry tons of precipitates drawn from stocks and current production were treated during the year. From this source and the stocks of cathode cadmium on hand there was produced a total of 259,883 pounds of metallic cadmium, which assayed 99.9925 per cent cadmium.

BRITISH COLUMBIA - Consolidated Mining and Smelting Company of Canada Limited reported that the cost of mining and milling a ton of ore was exactly the same as in 1935; the direct cost per pound of recoverable metal was slightly less due to the grade of the ore extracted, being about three-quarters of one per cent of metal content above 1935. Production in the lead smelting plant was an all-time high record and costs were an all-time low record; lead recoveries were slightly lower than in 1935. Lead production in the refinery increased steadily throughout the year, the tonnage for 1936 being 182,541 tons against 164,329 in 1935, the previous record year. Production in the zinc plant was 118,971 tons against 119,572 tons in 1935. While the cost of zinc in 1936 was .17 cents higher than in 1935, it was more than accounted for in lower silver credit. Zinc concentrates sold increased the zinc production to 125,694 tons; a purer grade of zinc was made and a product carrying 99.995 per cent zinc can be supplied regularly. Cadmium, a by-product metal from zinc reduction, and bismuth, a by-product metal from lead operation, added about \$400,000 to the receipts from the metal sales.

The fertilizer plant has been undergoing several changes to combine the operations of the direct production units with the new sulphur dioxide absorption and recovery plants. Up to 165 tons per day of excellent grade ammonium sulphate have been recovered at a cost slightly above the cost of that made directly from ammonia and sulphuric acid. A remarkably pure elemental sulphur is also obtained from these plants. All the gases from the zinc plant will now be treated, the sulphur from the fumes being recovered as ammonium sulphate, sulphuric acid and elemental sulphur—the last two being interchangeable. When the absorption plant proved successful, an appropriation was made to build further absorption plants to treat the tail gas from the sulphuric acid plant and to start recovery of the low-grade roaster gas from the lead plant. Two additional units have been added to the hydrogen plant (the limiting plant in the ammonia group), making a 37 ton increase in the ammonia production.

| Company | | on of Numb | | nnual Capacity tons of charge) | | | |
| Consolidated Mining & Smelting Co. Trail, B.C. 5 700,000 | | | | | | | |

According to the American Bureau of Metal Statistics, the lead refining capacity of the world in 1936 aggregated about 1,030,000 short tons in the United States and about 2,073,000 elsewhere; there was an increase of about 80,000 tons in capacity during 1936, occurring entirely outside of the United States; probably not more than 900,000 tons of the listed capacity in the United States and 1,500,000 tons elsewhere, a total of 2,400,000 tons, is to be rated as useful and effective, the remainder being obsolete, incapable of economical ore supply, or otherwise useless. Lead refining capacity of some of the more important lead producing countries, other than the United States, expressed in metric tons, are: Canada, 163,300; Mexico, 293,900; Belgium, 137,000; France, 119,700; Germany, 207,000; Great Britain, 165,800; Spain, 263,300 and Australia, 203,000.

⁽a) In general, output is reported in terms of base bullion allocated as far as possible to origin of ore, according to the American Bureau of Metal Statistics.

Of the output recorded for North America in 1936, Canada contributed 184,659 short tons, excluding lead exported to European countries. As a world producer of lead Canada ranked fourth in 1936.

Supplied by the American Bureau of Metal Statistics,

The American Bureau of Metal Statistics estimates the capacity of American zinc metallurgical works at the end of 1936 as being nominally for the production of 700,000 short tons of spelter per annum by distilling and 204,000 tons by electrolysis, a total of 904,000 tons, but the first-class effective capacity is something less, probably not more than for 850,000 tons, and perhaps materially less than that. The effective capacity outside the United States (exclusive of Russia) at the end of 1936 is estimated at 1,150,000 metric tons whereof about 250,000 tons were in Australia, Canada and Mexico, and about 900,000 tons elsewhere.

(a) The statistics in this table are the summaries of production as made by the metallurgical works of the world whose principal business is the reduction of ore. Insofar as they produce slab zinc from secondary material such is included. The quantity of such inclusion is, however, relatively small. Production is not allocated according to the origin of the ore except in the instances of the United States and Mexico beginning 1929. Slab zinc produced in the United States from Mexican ore has been separated and credited to Mexico in that year and subsequently. Other production from Mexican ore is included in figures of countries where treated.

Omitted from this table are possibly small productions in Belgium and Hungary, as to which information is uncertain.

- 15 -

Canadian gold production in 1936 totalled 3,748,028 fine ounces valued in Canadian currency at \$131,293,421. Canada in 1936, as a gold producing country, was surpassed only by the Union of South Africa and Russia. The origin of Canadian production is shown in the following table.

Table 21 - SOURCE OF CANADIAN FINE GOLD PRODUCTION, BY PERCENTAGES, 1932 - 1936.
