CANAL STATISTICS

1954

The amount of freight transported through the Canadian canals during 1954 totalled 30,070,701 short tons, a decrease of 3,302,363 tons or 9.9 per cent from the modern record of 33,373,064 tons which was established in 1953. All of the canals, except the Richelieu, reported lighter traffic than in the previous year, particularly for such commodities as barley, oats, rye, gasoline, petroleum oils, iron and steel, woodpulp, hard and soft coal, iron ore, and sand. Freight traffic at the Canadian Sault Ste. Marie canal declined to 2,607,968 tons from 3,389,409, a drop of 781,441 tons or 23.1 per cent; traffic at the Welland Ship canal decreased 10.4 per cent to 17,514,258 tons from 19,542,150; and, shipments transported through the St. Lawrence system fell to 9,637,034 tons from 10,081,992 or 4.4 per cent. The number of vessel passages and the registered net tonnage were also lower than in 1953. Vessel passages numbered 25,292 as compared with 27,563 and the registered net tonnage totalled 29,442,595 tons as against 32,542,585, a decrease of 3,099,990 tons or 9.5 per cent. The number of passengers carried rose, however, to 116,231 from 112,082. Of the total number of vessel passages, 21,066 or 83.3 per cent were of Canadian or British registry, 3,145 flew the American flag and, the remainder 1,081 were registered in various other countries. As shown in Table 5, the Canadian and British registered vessels transported 26,464,781 tons or 88 per cent of the total freight locked through the ten systems. At the Canadian Sault, Canadian bottoms carried 2,492,740 tons or 95.6 per cent of the total while at the Welland the percentage was 83.3 and at the St. Lawrence 94.1. Domestic vessels transported all the freight carried through the seven smaller systems.

Table 2 shows the total traffic on Canadian canals and the United States locks at Sault Ste. Marie divided according to the different systems through which it past, thus excluding duplications. From this table, it is possible to follow the volume of traffic moving to and from Lake Superior ports and Montreal and beyond, which during 1954 amounted to 482,352 tons as compared with 746,310 in 1953 and 567,139 tons in 1952. Traffic using the combination of the Sault Ste. Marie and Welland canals declined to 5,684,275 tons from 5,771,757

while that through the Sault only dropped sharply to 79,248,722 tons from 121,971,103, a decline of 35 per cent.

From this analysis, it can be ascertained readily, through an examination of the up and down movements, how much freight tonnage terminated or originated within certain regions or broad areas and used one or more canals. The totals of course, do not include the considerable amount of traffic which moves between ports on the same lake or between Lakes Michigan, Huron and Erie where no canal passages are necessary.

The total amount of freight shipped through the combined U.S. and Canadian Sault Ste. Marie system aggregated 85,415,349 tons, a decrease of 43,073,821 tons or 33.5 per cent due mainly to a decline in demand for iron ore. The grand total of all canal traffic thus dropped to 112,878,082 tons from the 1953 total of 158,472,825 tons.

Table 10 shows the volume of freight carried up and down the St. Lawrence canal system from and to outside points by vessels of Canadian and foreign registry, other than the United States. During 1954, the upbound total amounted to 428,633 tons, a decrease of 129,751 tons or 23.2 per cent from the previous year. Of this total foreign carriers transported 267,054 tons or 62.3 per cent as compared with 72.4 per cent in 1953. The down or outward movement shows that 320 foreign vessels carried 341,448 tons or 89.9 per cent of the total of 379,648 tons as against 311 vessels with 317,166 tons or 90 per cent of the 1953 total of 352,415. Vessels of Norwegian, German, British, Swedish and Netherlands registry predominated.

In the year just ended, the season of navigation was considerably shorter than in the previous year for the Sault Ste. Marie, the St. Lawrence and four of the smaller canals. The Canadian Sault operated 246 days, sixteen less than in 1953 while the St. Lawrence, which opened April 13th and closed December 14th, was in operation a total of 243 days as compared with 259 days a year earlier. The Welland Ship canal operated 268 days in both years.

SOURCE AND TREATMENT OF DATA

The traffic statistics of the Canadian canals are collected through the local agents of the Department of Transport and compiled by the Transportation and Public Utilities Section of the Dominion Bureau of Statistics. Each vessel using a canal must make a report to the officer in charge of the canal, giving the details of the vessel tonnage, draught, cargo, etc. There are no tolls charged for the use of the canals and at Sault Ste. Marie, Canadian and United States vessels use the Canadian or United States locks as convenient. There are five locks at Sault Ste. Marie, one Canadian and four United States locks. Two of the locks on the United States side are 450 feet longer and are deeper than the Canadian lock and all four are wider. Because of the greater facilities on the United States side of the river a much larger portion of the traffic uses the United States locks than uses the Canadian lock.

The traffic statistics are complete for each canal and vessels and cargoes passing through two or more canals in going from port of clearance to port of destination are included in the statistics for each canal used. A large percentage of the upbound traffic through the St. Lawrence canals uses the Welland Ship and also the Sault Ste. Marie canal, mostly on the United States side, and a large percentage of the downbound traffic also uses the Welland Ship Canal while a smaller percentage passes through the locks at Sault Ste. Marie. Practically all the Ottawa River canals traffic uses the Lachine locks of the St. Lawrence canals and is included in the St. Lawrence way traffic. The totals for all Canadian canals consequently contain a large amount of duplication.

In Table 2 of this report duplications are eliminated except that freight which was unloaded and re-loaded was not considered a duplication. Thus, grain transhipped at Georgian Bay and Lake Erie ports is not considered as duplication when passing down the Welland Ship Canal.

Previous to 1940, vessels of Canadian and British registry were shown under "Canadian" in the tables and all other vessels were shown under "United States". Only a very small percentage of these foreign vessels were other than United States vessels but they have been segregated and shown separately in tables of reports subsequent to 1939.

Also in classifying ports of departure and ports of destination of vessels all foreign ports have been

included under "United States". Here, also, traffic to foreign ports other than United States is but a very small percentage of the total.

As shown in Table 17, Canadian vessels carry by far the major portion of the total of all grain moving down the Welland Ship Canal.

The number of vessels and net registered tonnages using each canal are shown in Table 6 and the number of passengers and cargoes are shown in separate tables for each canal.

"Way" vessels and "way" cargoes are those from and to ports on the canals or using only a portion of any canal. Thus, a vessel from Montreal to Hull would be recorded as way on the St. Lawrence canals and "through" on the Ottawa River canals. Vessels and freight above Prescott and points on the Lachine Canal are classed as "through" for the St. Lawrence canals and all vessels and freight passing through the entire length of any canal are classed as "through".

The freight rates for Canadian grain shown in Tables 7, 8 and 9 are weighted averages. They include transportation charges and such trimming and other charges as are absorbed by the vessel operator. Where storage charges were made, the combined rates are shown separately. The trimming charges vary at different ports and are also affected by the overtime required to complete the job. Tables for Sault Ste. Marie, Welland Ship and St. Lawrence Canals show the complete list of commodities for which statistics are tabulated; for the other canals only such of these commodities in the list as were carried, are shown.

The directions "Up" and "Down" are according to the direction of the flow of the water except for the Rideau and Trent Canals, which overcome heights of land and consequently use water flowing in opposite directions. For the Rideau Canal the direction from Lake Ontario towards the Ottawa River is classed as "Down", and for the Trent Canal from Lake Huron towards Lake Ontario is classed as "Down". St. Peter's Canal crosses an isthmus and connects St. Peter's Bay with the southerly end of the Bras d'Or Lakes from the northerly end of which access is had to the Atlantic Ocean. The direction from the Bras d'Or Lakes to St. Peter's Bay is classed as "Down".

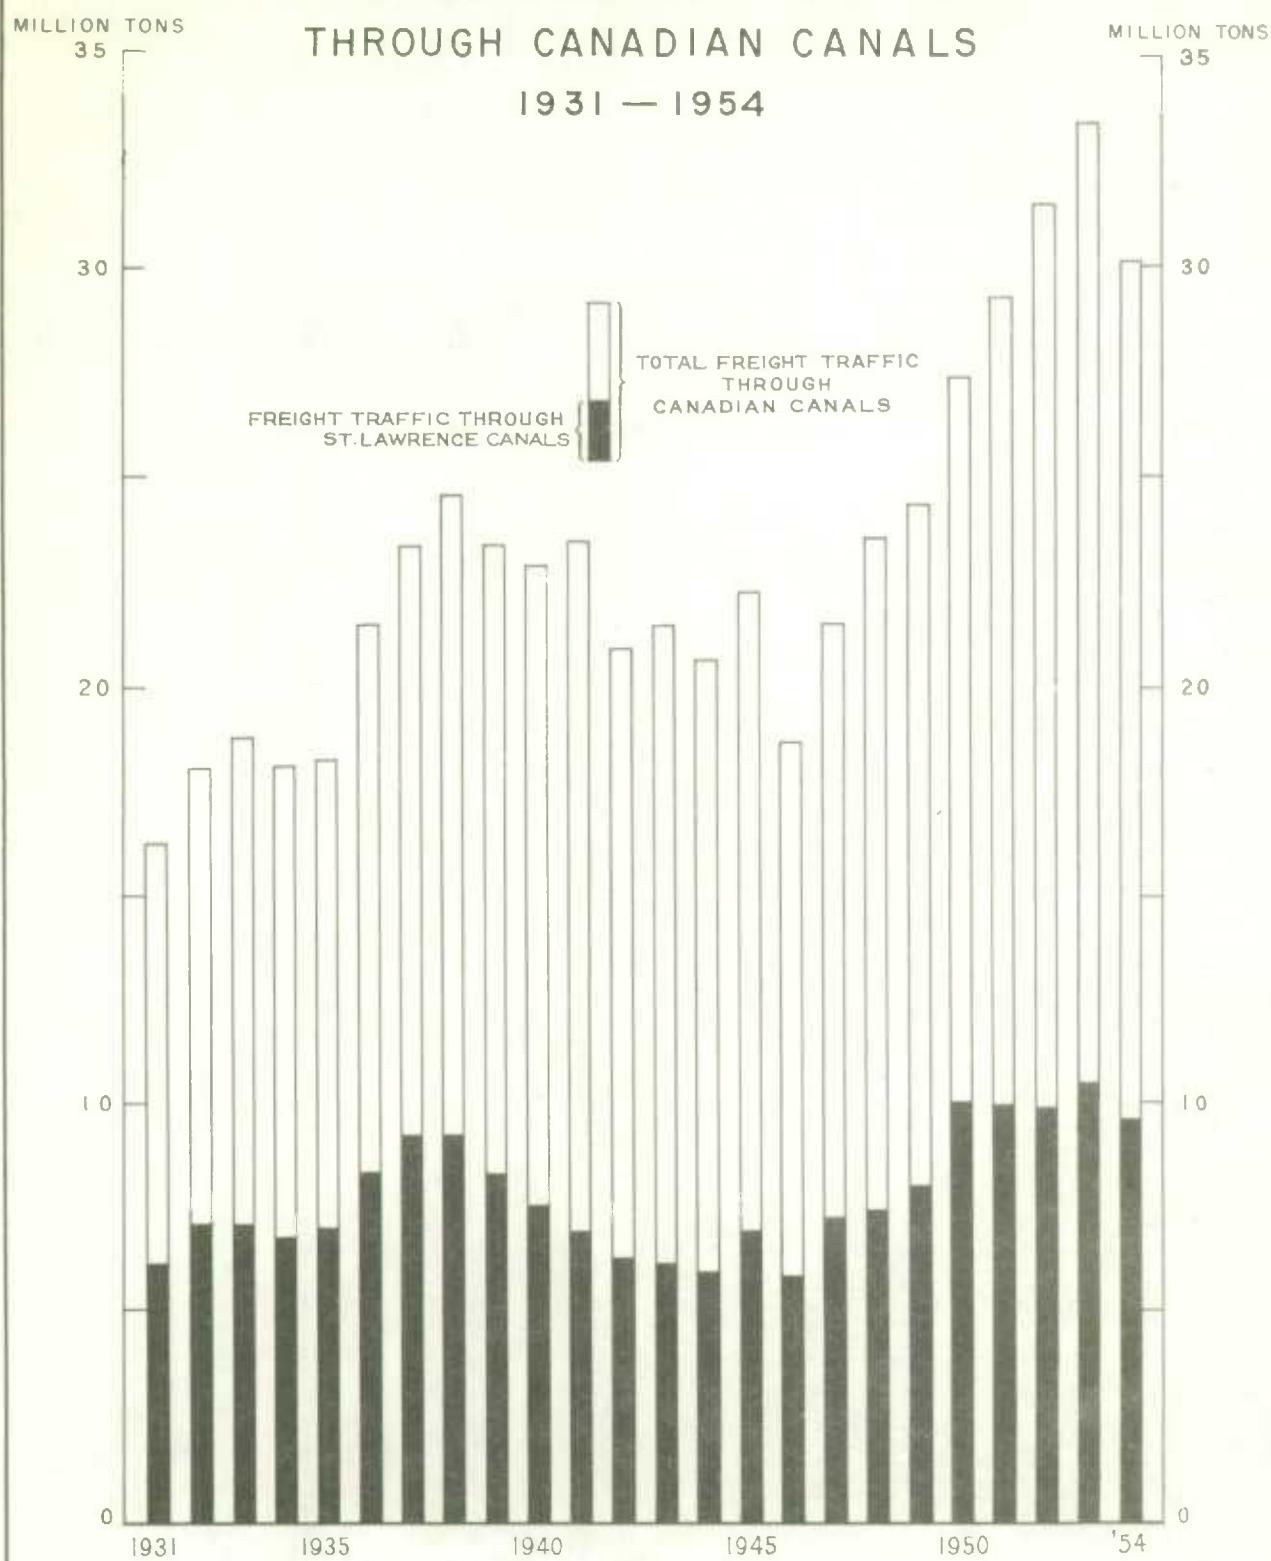

Chart

Chart 1 presents the total freight carried through all Canadian canals compared with the amount shipped through the St. Lawrence Canals over the period 1931 to 1954.

Total traffic on all canals rose from 16.2 million tons in 1931 to a record 33.4 million tons in 1953, an

increase of 106.2 per cent. Shipments through the St. Lawrence canals generally follow the trend for all canals and weighed over 10 million tons in 1953. Freight shipped through the St. Lawrence represented 37.0 per cent of total canal freight in 1931, 28.4 per cent in 1943 and 31.9 per cent in 1954.

	Sturgeon Lake	Lindsay	8.35	1	142	33	6		
St. Andrew's	Red River, fifteen miles north of Winnipeg	Port Perry (Scugog Branch)	26.65	None	—	—	4.5		
			—	1	215	45	17		

1. Navigable depths occasionally are less due to extreme low water levels.

2. Least depth in channels, 7 ft.

3. Least depth in channels, 25 ft.

4. Depth of canal prism is 17 ft.

5. With Lake Ontario at elevation 244 ft.
