TELEPHONE STATISTICS

1935

2-305-057-674

The number of telephones in Canada increased from 1,197,029 (revised) in 1934 to 1,208,815, or by less than one per cent. This is the second year to show an improvement since the low point was reached in 1933. Capital revenues, expenses and net revenue, however, all showed decreases from 1934. The number of conversations as estimated from counts made on representative days by the large systems also showed a small reduction from 2,304,259,566 in 1934 to 2,296,237,566 in 1935 although long distance conversations increased. Only four countries, the United States, France, Germany and the United Kingdom, have a greater number of telephones installed and in respect to population only the United States has a greater density.

The Alberta Government system has been selling its rural lines to associations formed to purchase and operate these lines. A number of these started operation late in 1934 and in 1935. These greatly increase the number of systems in Alberta and account for much of the decrease in the provincial system.

The Dominion excise tax on long distance calls has been excluded from both revenues and expenses and is shown as a separate item at the end of the table on expenditures. The telephone organizations consider that they act as agents for the Government in collecting this tax from the public.

The telephone density based on the estimated population for 1935 showed decreases in Prince Edward Island, New Brunswick, Quebec, Ontario and British Columbia and increases only in the three Prairie Provinces. Nova Scotia showed the same density for both years.

The statistics of individual systems in Table 18 include only the large systems. The Bell Telephone system is by far the largest in Canada, accounting for 58 per cent of the investment and 57 per cent of the telephones. The three Prairie Provinces are served by the respective provincial systems which operate in the larger cities, except in Edmonton which operates its municipal system and they furnish long distance service to the smaller systems, most of which are operated on a co-operative basis.

Table 19 shows the number of telephones for 1935 in the large cities in Canada, segregated according to manual switchboard and automatic switchboard. Table 20 shows the totals for these cities back to 1910, or as far back as the data were available, and the number per 100 population. The populations for inter-census years are estimated on the basis of the increase each year being one-tenth of the difference between decennial censuses. The telephones in these cities reached the greatest density at 24.14 per 100 population in 1930. Although the number of telephones increased in 1934 and 1935, the rate of increase was less than the estimated increase in population and consequently the densities were less.

STATISTIQUES DU TELEPHONE

1935

2,303,087,604

Le nombre de téléphones, au Canada, de 1,197,029 (chiffre revisé) qu'il était en 1934, est passé à 1,208,815, ce qui est une augmentation de moins de 1 p.c. Depuis le minimum atteint en 1933, c'est la deuxième année qui accuse une augmentation. Toutefois le capital engagé, les recettes, les dépenses et le revenu net sont, dans chacun des cas, moindres qu'en 1934. Le nombre de conversations téléphoniques, établi sur les estimations de certains jours types par les grandes compagnies, a subi une légère diminution; en 1934 il s'est établi à 2,304,259,566 et en 1935, à 2,296,237,566 appels. Les appels interurbains ont toutefois augmenté en nombre. Quatre pays seulement, les Etats Unis, la France, l'Allemagne et le Royaume-Uni, comptent un plus grand nombre d'installations téléphoniques que le Canada, et en fonction de la population, le Canada ne le cède qu'aux Etats Unis par le nombre de ses appareils.

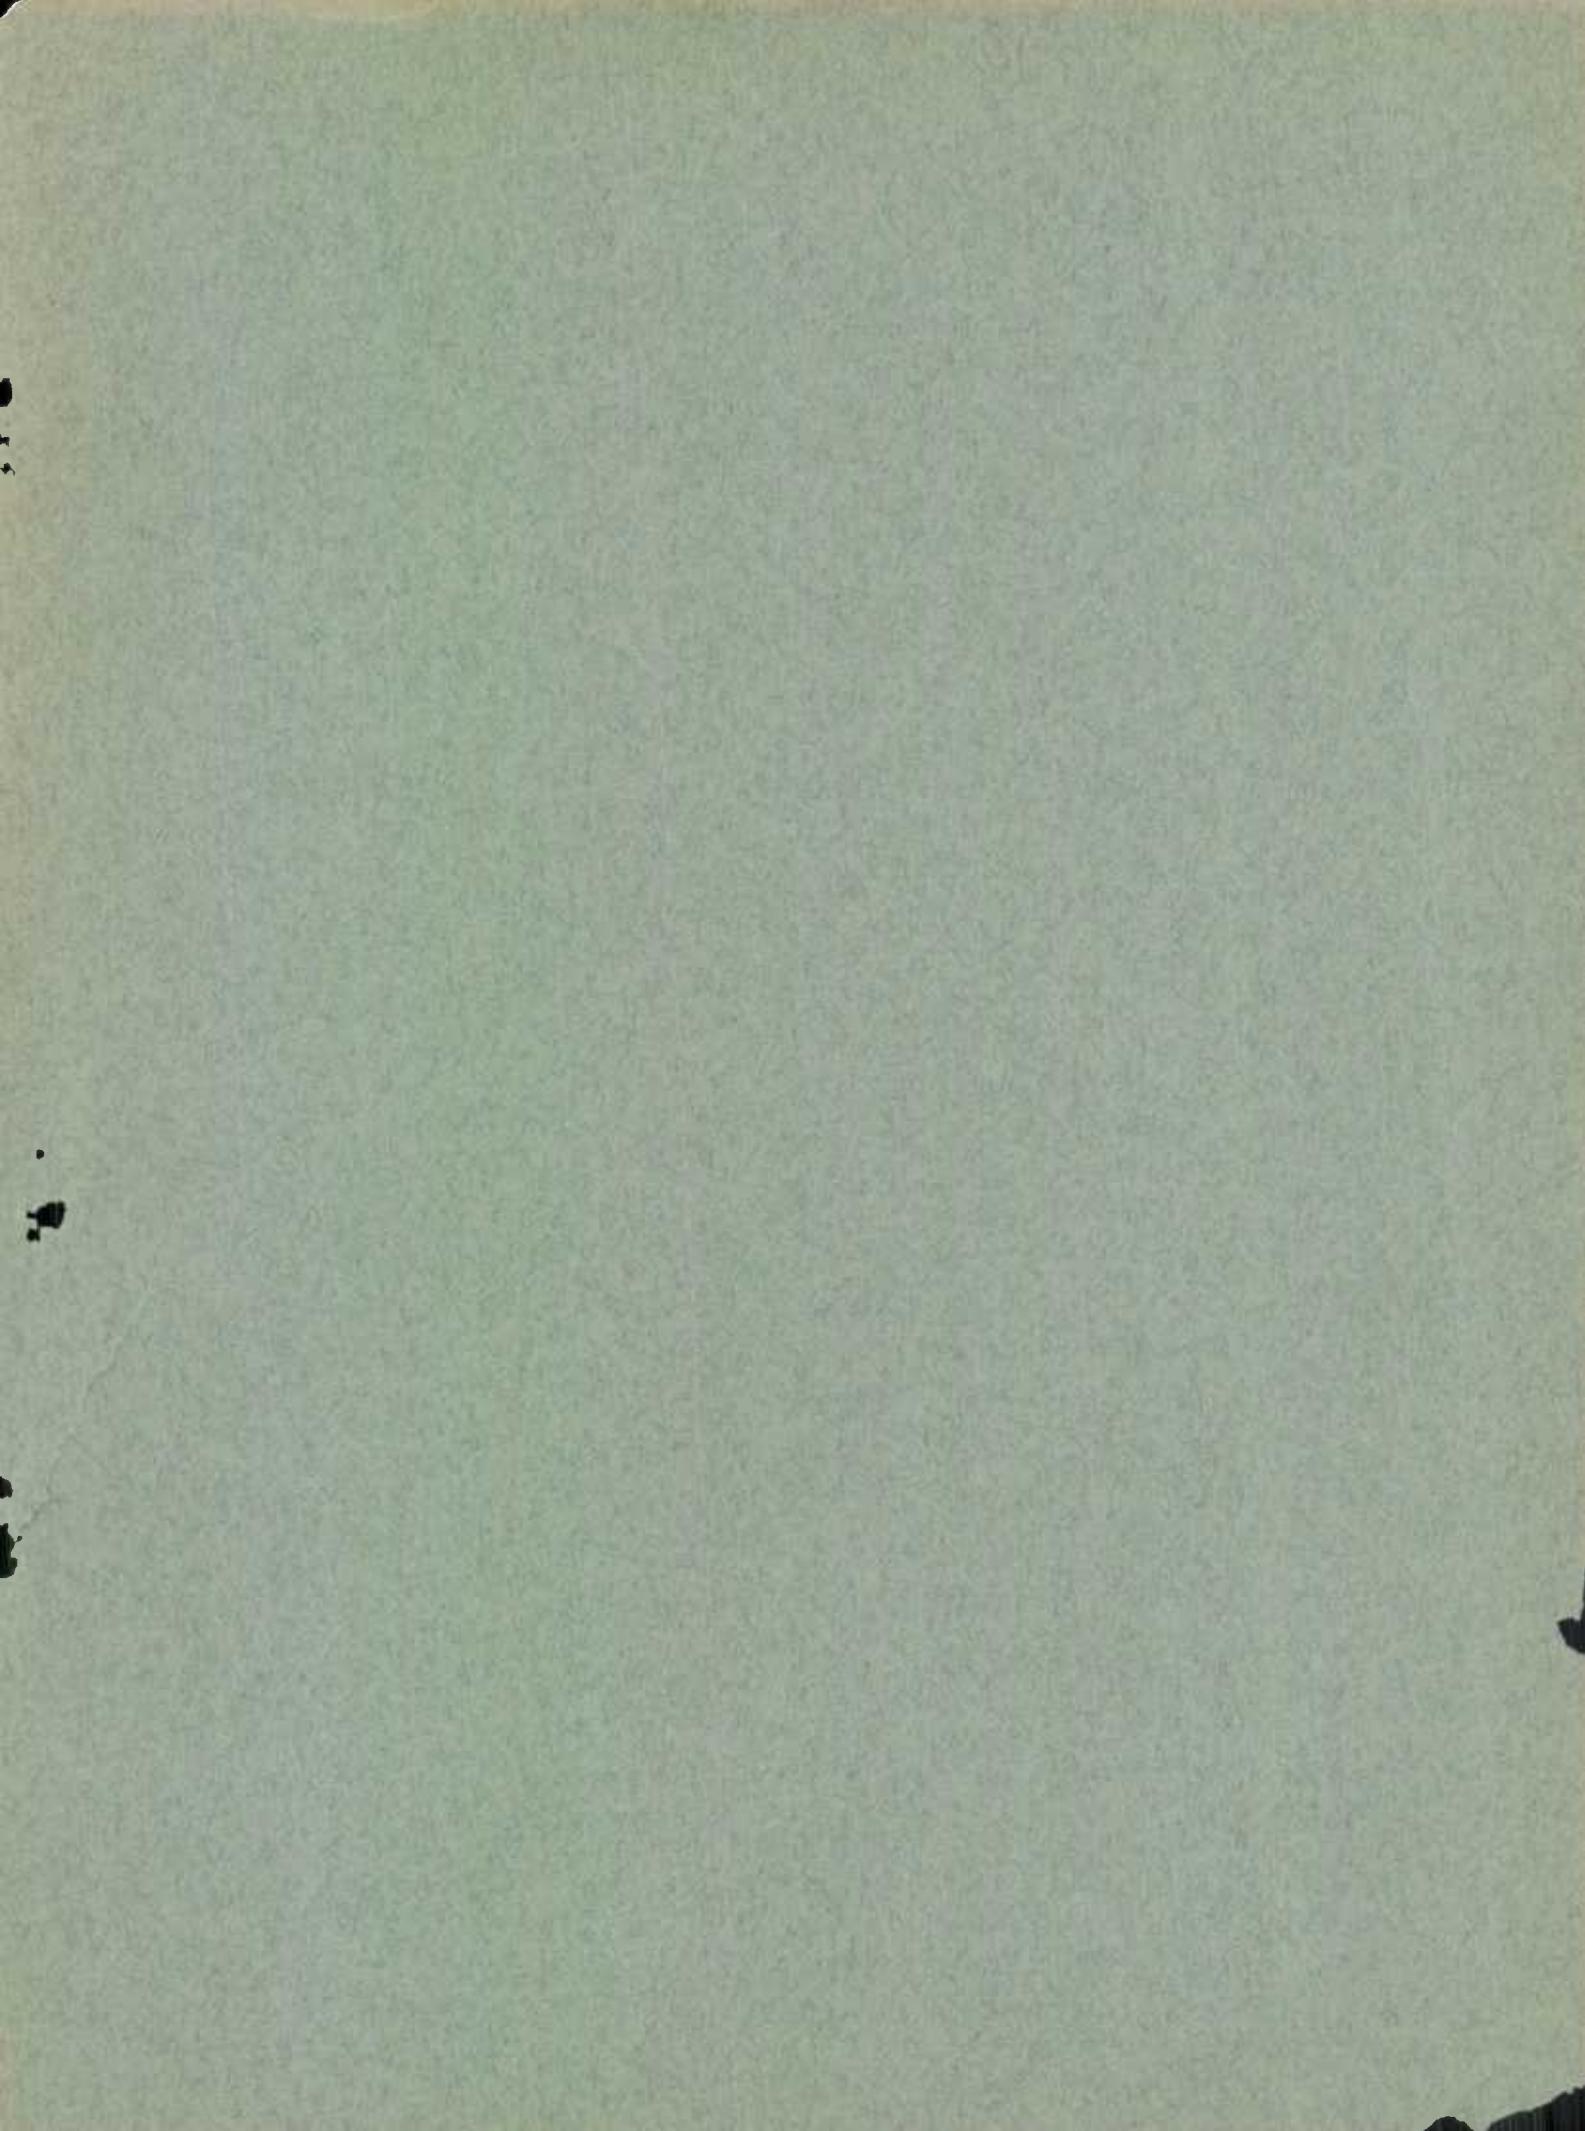

Le réseau provincial de l'Alberta a disposé de ses lignes rurales en faveur d'associations organisées pour les acheter et les exploiter. Dans plusieurs cas l'exploitation de ces lignes a commencé tard en 1934 et en 1935. A cet état de chose faut-il attribuer la forte augmentation dans le nombre des réseaux de l'Alberta ainsi que la forte diminution dans ce système provincial.

L'impôt fédéral d'accise sur les appels interurbains a été séparé des postes des revenus et des dépenses, et devient un poste par lui-même au bas du tableau des dépenses. Les organisations téléphoniques se considèrent comme agents du fisc fédéral dans la perception de cette taxe publique.

La densité des appareils téléphoniques en fonction de la population estimative de 1935 indique des régressions dans les provinces suivantes: Ile du Prince Edouard, Nouveau-Brunswick, Québec, Ontario et Colombie Britannique, et des progressions dans les trois Provinces des Prairies exclusivement. Dans la Nouvelle Ecosse, la densité reste identique les deux années.

Les statistiques du tableau 18, sur chaque réseau, ne portent que sur les réseaux téléphoniques de première importance. La compagnie Bell est de beaucoup la plus considérable au Canada; en effet, elle représente 58 p.c. des capitaux engagés et 57 p.c. des appareils téléphoniques. Les trois Provinces des Prairies ont chacune leur réseau provincial qu'elles exploitent dans les grandes villes, sauf Edmonton, qui a son réseau municipal, et elles mettent un service d'appels interurbains à la disposition des lignes secondaires, la plupart exploitées sur le principe de coopérative.

Le tableau 19 montre, dans les grandes villes du Canada, le nombre de téléphones en 1935, en les répartissant en deux groupes: téléphones à multiples manuels et téléphones à multiples automatiques. Le tableau 20 établit le total des mêmes villes jusqu'à 1910 ou jusqu'à l'année où ces statistiques peuvent exister, ainsi que le nombre d'appareils par cent habitants. La population des années d'un recensement à l'autre est computée sur la croissance annuelle, soit un dixième de la différence entre deux recensements décennaux. La densité la plus forte, dans le nombre de téléphones de ces villes, s'est établie à 24.14 par cent habitants en 1930. Si le nombre d'appareils accuse une progression en 1934 et 1935, la raison de l'augmentation reste inférieure à l'augmentation estimative de la population, de sorte que la densité est en régression.
