INDEX NUMBERS  
OF  
RATES FOR ELECTRICITY FOR RESIDENCE LIGHTING  
AND  
TABLES OF MONTHLY BILLS

The attached tables of index numbers of rates and monthly electric light bills include charges for lighting in private houses and for electricity used for operating electric appliances such as irons, toasters, percolators, grills, heaters, vacuum cleaners, stoves, etc., when such electricity is sold at the same rate as the lighting current. These data do not indicate the general price of electricity which includes the price paid for power and commercial lighting. In most large stations the consumption of electric energy for power purposes is by far the greater part of the total output; current for power is sold at relatively much lower rates than lighting current. It is often this large consumption for power purposes that makes possible the relatively low rate charged for lighting current.

On account of the numerous and varied methods of charging for electricity, the most general method being on a sliding scale, the unit price decreasing with increased consumption and a fixed service charge, it was impossible to make direct comparisons of rates. Consequently monthly bills were computed for different quantities of electricity and where service charges were made on floor area, or the number of rooms and on the number of lamps, or outlets, the following were used:

Monthly Consumption K.W.Hrs.	Rooms No.	Floor Areas Sq.ft.	Lamps 16 c.p. or 25 watts.
15	6	1,000	8
20	7	1,400	12
40	8	1,600	16
60	8	1,600	20
180	10	2,000	25

A cooking load of 6 kilowatts for the consumption of 180 kilowatt hours was also used in computing service charges where applicable. In all cases where a discount for prompt payment was allowed such discount was made in computing the bills. Where no service charge was made and where consumption charges were on a flat rate the bills were computed accordingly.

Monthly consumptions of 180 kilowatt hours would be too large for lighting alone in practically all cases and would include electricity used for cooking. The bills, however, were computed only at the lighting rate, both in municipalities where the same rate was charged for both services and in municipalities where different rates for lighting and cooking were in effect. The only recognition of the cooking service was to allow a range load of 6 kilowatts in those municipalities with a service charge for cooking on the load basis.

The consumptions of 15, 20, 40, 60 and 180 kilowatt hours per month were selected after careful consideration of all data available and they were selected not only because they were approximately the average consumptions of many of the municipalities, but because they covered a range that could be used for comparative purposes by a large majority of the municipalities.

The method of computing the index numbers for the municipalities was as follows. The bill in each case for 1913 was used as the base represented by 100 and the amounts of the bills for 1923, 1924 and 1925 were divided by the amount of the 1913 bill and multiplied by 100, the result being the respective index numbers for these years.

The index numbers for each province were weighted, to give correct values to changes occurring in the large cities where the greater part of electricity is consumed, by multiplying the index numbers of each municipality in each province by the respective number of customers for 1925 and dividing the sum of the products by the sum of the number of customers. This procedure made it necessary to select one of the five sets of index numbers for each municipality and the one selected was for the consumption quantity which was closest to the actual average consumption for that municipality.

The Dominion index numbers were computed by adding the products of customers and municipal index numbers, derived from computing the provincial index numbers for each year as explained above, by the total number of customers of the municipalities included in this report.

There are a great many factors entering into the price of electricity and when comparing the prices of different municipalities or even of one municipality for different years, these factors must be given proper weight. These factors include costs of power houses, machinery, power dams, storage dams, flooded lands, water rights, transmission lines, right of way, substations, distribution lines, etc. operating expenses including losses of power through transformers, transmission lines and distribution lines

-3-

fuel costs, labour, maintenance, depreciation through both wear and obsolescence, interest charges, taxes, and the nature of the market or load factor which governs the extent to which the equipment is utilized. The effect of each of these factors on the price charged for electricity for residence lighting varies with different plants and locations and without an exhaustive analysis, it is impossible to assign even approximate values to the factors.

Five tables of monthly bills and index numbers have been compiled for each municipality, one table for each of the five representative consumptions mentioned above (15, 20, 40, 60 and 180 kilowatt hours). Against the name of every municipality there will be found in one of the five tables a capital "A". This is to indicate which of the five consumption quantities is most nearly typical of the actual average consumption for the municipality concerned. Thus every municipality where the average consumption was under 17.5 kilowatt hours has a capital "A" opposite its name in the table for a consumption of 15 kilowatt hours, and where the average consumption was between 17.5 and 30 kilowatt hours an "A" was placed in the table for 20 kilowatt hours, and so on.

The municipalities included in these tables are not all the cities, towns, etc. now supplied with electricity nor all the cities and towns supplied with electricity in 1913, but with a few exceptions they are all the municipalities for which comparable data could be secured for 1913 and the last three years and the customers in these municipalities were over 75 per cent of the total number in Canada. In some towns the rate had changed from a flat rate in 1913 to a sliding scale in 1923 and for others the rates for 1913 were not known so that comparisons were not possible.

The weighted index number for Canada shows a reduction in the price of electricity for residence lighting of 27.3 per cent from 1913 to 1925. When it is considered that the prices of practically all commodities have been increased materially as have also the cost of services, such as transportation, telephone, professional services, etc., this reduction is outstanding. The index number of wholesale prices for 1925 was 160 based on 1913 prices. The commodity prices which have decreased are very few and include nickel, copper, hides, gasoline and sulphur, and many of these were affected by over production, lack of market, rate wars, etc. None of these factors except competition have entered into the reduction of the price of electricity for lighting.

The average price for the total amount of electricity sold in Canada for all purposes including both power and lighting for 1913 is not available but the average cost to consumers including all service charges was .87 cent in 1919,

4

.91 cent in 1920, 1.04 cents in 1921, .92 cent in 1922, .83 cent in 1923 and .81 cent in 1924. These averages are affected by large increases in production for power purposes and also an increased lighting load, but they are interesting and give an indication of the trend of prices of electricity.

It will be noted that the index numbers of the provinces follow very closely those of their respective large cities, due to the preponderance of the customers being in these cities. Thus the index number for Manitoba was lowered only a fraction of a point on account of no change having been made in the Winnipeg rates. The lighting rates in Winnipeg, however, were the lowest in Canada in 1913 and even in 1925 only a few other municipalities had rates that were lower. The greatest change was in Ontario index number which in the 12 years, 1913 to 1925, fell 38.1 points or to 61.9. British Columbia was second with an index number in 1925 of 68.9, New Brunswick was third with 77.4 and Quebec was fourth with 74.2. The decreases in the prairie provinces were slight and Prince Edward Island showed an increase of 19.8 points.

The effects of fixed service charges and meter rentals are more apparent in the bills for small consumptions than for 40 kilowatt hours consumption and upwards and with sliding scales of rates assist in diminishing the unit price with increased consumption. These two factors explain some apparent inconsistencies when comparing bills of the various consumptions in one place with those of another. A large majority of the municipalities made a minimum charge and in some cases the minimum charge was greater than the computed bill for both 15 and 20 kilowatt hours. This is the explanation for the same charge for both of these consumptions being shown for a few municipalities.

Although these tables were compiled with great care, it is possible that through misinterpretation of schedules or incomplete or incorrect data being received, errors have been made in computing the bills and the Bureau would be grateful to have any errors called to its attention for correction in future issues.

ERRATA

INDEX NUMBERS  
 OF  
 RATES FOR ELECTRICITY FOR RESIDENCE LIGHTING  
 AND  
 TABLES OF MONTHLY BILLS

Page 10 - Monthly Consumption of 60 Kilowatt Hours-

<u>Montreal</u>	<u>Reads</u>	<u>Should Read</u>
Monthly Bills, 1913 . . . . .	2.96 . . . . .	3.96
Index Numbers, 1923 . . . . .	85.1 . . . . .	63.6
1924 . . . . .	81.2 . . . . .	60.6
1925 . . . . .	77.9 . . . . .	53.0

This correction affects the third paragraph on page 3 making the reduction in the price of electricity for residence lighting read 30.9 per cent from 1913 to 1925 instead of 27.3 per cent. It also affects the second paragraph on page 4, the index number for Quebec in 1925 being 61.9, the same as for Ontario.

The table at the foot of page 4 should read:

INDEX NUMBERS  
(Weighted)  
of  
RESIDENCE ELECTRIC LIGHT RATES  
 Base 1913 rates = 100

	<u>1925</u>	<u>1924</u>	<u>1925</u>
Canada . . . . .	73.8	71.5	69.1
