INDEX NUMBERS  
OF  
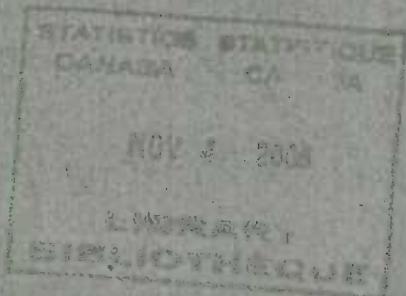

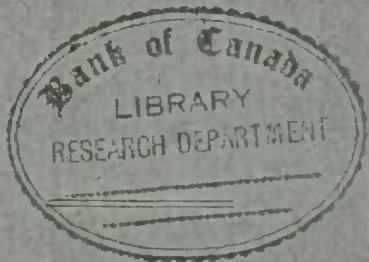

COST OF ELECTRICITY FOR DOMESTIC SERVICE  
AND  
TABLES OF MONTHLY BILLS FOR DOMESTIC SERVICE,  
COMMERCIAL LIGHT AND SMALL POWER

1940

This report on the cost of specific quantities of electricity for specific uses and index numbers of the cost of electricity for domestic use, first issued in 1926, brings the data up to the end of 1940.

It should be understood that these index numbers are only for the cost of electricity for domestic use and should not be used as indicating trends of costs for power and for other purposes. Also the bills are only for the quantities and uses shown and should not be used as indicating the "cost of electricity" except in a very general way. The unit cost, or cost per kilowatt hour of electric energy in general varies according to the nature of the use and according to the magnitude of the consumption, and because these vary so greatly as between industries and as between municipalities an average cost for all electricity consumed in any municipality is of little value unless the nature of the uses and size of consumption for each use are known.

The relationships between the capacity of a system to produce and distribute electricity and the total consumption and also the average rate of consumption per day and at different times during each day and during the year are very important factors in the costs of electricity. This relationship between capacity and output is generally improved when the customers include pulp and paper mills or other customers using large quantities of power fairly constantly throughout the 24 hours of each day and also throughout the year. It is also generally improved as the number and the variety of customers are increased. There are several other factors entering into the costs and they should all be considered when making comparisons of costs in different municipalities. Because of the difficulty in giving proper weight to these many factors the Bureau has not attempted to make deductions, but has computed the actual cost to consumers for specific quantities for specific purposes in the municipalities covered by the report.

A frequent query, however, is which municipality has the lowest cost of electricity. This cannot be answered, but the following tables show the municipalities in Canada having the lowest bills for these selected quantities and uses and, while the domestic service bills will probably include the average for most municipalities, it is quite probable that for larger loads and consumptions for commercial light and for power other municipalities would have the smallest bills. The fact that no one municipality had the smallest bill for all consumptions in the three classes of service indicates the caution which should be exercised when making comparisons as between municipalities. The lowest bill in each case is underlined.

Cornwall, St. Jerome and Jonquiere were not included in previous reports and consequently were not shown in the tables below for previous years. These and several other municipalities were added to the list in this 1940 report. It is quite possible some municipalities for which bills have not been computed have as low or lower bills than the bills shown in these tables, and consequently there is no guarantee that the bills shown are the lowest in Canada.

Orillia and Jonquiere each operate their own municipal hydro-electric plant and distribution system. Sault Ste. Marie operates a municipal distribution system buying power from a commercial hydro-electric plant. St. Boniface, Cornwall and St. Jerome are served by commercial hydro-electric systems.

g - Minimum bill.

Domestic services include delivery of electricity to private residences for lighting, cooking, water heating and the operation of various electrical appliances such as washing machines, irons, vacuum cleaners, etc. Commercial lighting includes delivery of electricity to stores, offices, factories, etc., for lighting purposes only. Sign lighting is generally in a separate category and the rates are different from those for commercial lighting. Also street lighting is in another class. Power service includes delivery of electricity for the operation of electric motors.

The selection of domestic service consumptions ranging from 15 kilowatt hours to 500 kilowatt hours per month will probably contain bills close to the majority of bills for each of the municipalities listed and also the commercial light bills ranging from 50 kilowatt hours to 10,000 kilowatt hours and for loads from 1 to 50 kilowatts will undoubtedly correspond to a large number of actual consumptions in these municipalities. The selection of power loads and consumptions was more difficult. It is a common practice for power companies to make a flat charge per horse power or kilowatt of connected load. The connected load for which the bill is made is either the total rated capacities of all connected motors, a percentage of such total, or the maximum or peak rate of power taken over a period of time. The period is 30 minutes in many municipalities, but it varies. Also adjustments of the peak load governing the charge are made monthly in some cases and in others the peak established in one year is carried through for a full year, if not exceeded, before a downward adjustment is made. It is also common practice to quote special rates for large power customers although the regular rates extend in many municipalities beyond 100 horse power, the largest load included in these tables. Consequently, the only practicable tabulation was one restricted to small loads, ranging from light to approximately maximum consumptions for an eight-hour per day operation.

A consumption of 200 hours use per month would mean a 100 per cent use of the load for an average of 8 hours per day for 25 days and 100 hours use would mean a 50 per cent use of the load for the same time, or 100 per cent use for half the time, etc. If the connected load was computed on 80 per cent of the rated capacity of the motor, 100 hours use for 100 horse power load would mean 125 horse power motor operating 80 hours at full capacity and using 7,457 kilowatt hours per month.

In practically all cases the commercial bills were computed for unrestricted 24-hour service. A service restricted to 10 hours, from 7 a.m. to 6 p.m., is sold at a lower rate than the unrestricted 24-hour service in many municipalities. The exceptions are indicated by footnotes to the tables. No penalty was included for low power factors and no allowances were made for customers' deposits with the distributor to guarantee payment of bills, or other miscellaneous factors which enter into the bills in some municipalities.

In computing the domestic service bills certain assumptions were necessary in computing service charges where these charges were based on the number of rooms, the floor area, or the number of lamps, outlets or connected load. The bases used are shown at the top of the table. The maximum load for lighting and small appliances was taken at 850 watts and with a refrigerator at 1,000 watts. The load for an electric stove was taken at 8 kilowatts and for electric water heaters at 750 watts, except as indicated by footnotes. The large consumptions would apply almost exclusively to municipalities where water heater consumptions were charged for on flat rate bases, or where water heaters of large capacities were used at metered rates. In municipalities where water heater consumptions are metered the capacities are seldom factors in computation of the bills. Where service charges were based on two wire and on three wire service, the larger charge was used only for consumptions of 300 and 500 kilowatt hours or in other words, where an electric stove was connected. Footnotes indicate the municipalities having manufactured or natural gas which has a tendency to reduce use of electricity for heating purposes. The more or less general increase over 1938 bills is due to the inclusion of a Federal Tax of 8 per cent on all bills for domestic use, which became effective on September 13, 1939.

In the column headed "Class of Station" the letters "C" for commercial companies and "M" for municipal or publicly operated systems refer to the distributors which are not in all cases the organizations generating the power, but the letters "H" for hydraulic or water power and "F" for fuel or steam, gas, or oil engines indicate the nature of the power used by the generating plant to produce the electricity sold in each municipality. In some cases hydro-electric plants have auxiliary thermal engines used for peak loads or in emergencies, but such plants are classed as hydraulic.

The index numbers of cost of electricity for domestic services were computed by using the bill closest to the actual average bill for each municipality in 1935-39 and weighting them by the average revenue from domestic service in this period. The index numbers for the provinces and for Canada were computed in the same manner using the date for only the municipalities included in this report. The base has been changed from 1926 = 100 used in previous reports to the average of 1935-1939 = 100.
