INDEX NUMBERS
OF
COST OF ELECTRICITY FOR DOMESTIC SERVICE
AND
TABLES OF MONTHLY BILLS FOR DOMESTIC SERVICE,
COMMERCIAL LIGHT AND SMALL POWER

1949

This report on the cost of definite quantities of electricity for specific uses and index numbers of the cost of electricity for domestic use, issued since 1926, brings the data up to the end of 1949.

It should be understood that these index numbers are only for the cost of electricity for domestic or residential use and should not be used as indicating trends of costs for power in industry and for other purposes. Also the bills are only for the quantities and uses shown and should not be used as indicating the "cost of electricity" except in a very general way. The unit cost, or cost per kilowatt hour of electric energy in general varies according to the nature of the use and according to the magnitude of the consumption, and because these vary so greatly as between industries and as between municipalities an average cost for all electricity consumed in any municipality is of little value unless the nature of the uses and amount of consumption for each use are known. Further, industrial power costs vary as to whether power used is "primary" or "secondary", i.e. off-peak power taken when available during hours of low consumption or demand.

The relationships between the capacity of a system to produce and distribute electricity and the total consumption and also the average rate of consumption per day and at different times during each day and during the year are very important factors in the costs of electricity. This relationship between capacity and output is generally improved when the customers include pulp and paper mills or other customers using large quantities of power fairly constantly throughout the 24 hours of each day and also throughout the year. It is also generally improved as the number and the variety of customers are increased. There are several other factors entering into the costs and they should all be considered when making comparisons of costs in different municipalities. Because of the difficulty in giving proper weight to these many factors the Bureau has not attempted to make deductions, but has computed the actual cost to consumers for specific quantities for specific purposes in the municipalities covered by the report. The cost to the consumers includes not only the amounts accruing to the distributor, but also all federal, provincial and municipal taxes on such purchases. Discounts for prompt payment have been deducted from gross bills wherever granted.

A frequent query, however, is "which municipality has the lowest cost of electricity". This cannot be answered satisfactorily, but the following tables show the municipalities in Canada having the lowest bills for these selected quantities and uses and, while the domestic service bills will probably include the average for most municipalities, it is quite probable that for larger loads and consumptions for commercial light and for power other municipalities would have the smallest bills. The fact that no one municipality had the smallest bill for all types of consumptions in the three classes of service indicates the caution which should be exercised when making comparisons as between municipalities. The lowest bill in each case is underlined.

There is a slight possibility that some municipalities from which bills have not been collected and computed may have as low or lower bills than the bills shown in the tables below, and consequently there is no guarantee that these bills are the lowest in Canada.

Of the towns and cities shown, Orillia, Jonquiere and Rivière du Loup operate their own municipal hydro-electric plant and distribution system. Kenora, Sault Ste. Marie and Calgary operate their own municipal distribution systems, buying power from commercial hydro-electric plants. Port Arthur, Belleville, Guelph, Niagara Falls and Welland own and operate their own municipal distribution systems, buying power from the provincial hydro-electric system. Commercial hydro-electric systems serve Trail, B.C., and St. Jerome, Que.

g - Minimum bill.

Domestic services include delivery of electricity to private residences for lighting, cooking, water heating and the operation of various electrical appliances such as radios, washing machines, irons, vacuum cleaners, etc. Commercial lighting includes delivery of electricity to stores, offices, factories, etc., for lighting purposes only. Sign lighting is generally in a separate category and the rates are different from those for commercial lighting. Street lighting is also in another class. Power service includes delivery of electricity for the operation of electric motors.

The purpose of the present data is to provide an index of the cost to consumers of the domestic service to include in the Bureau's "cost of living index" and to provide data for comparative purposes on the cost of electric service in the principal municipalities in Canada.

Because of the various methods of computing costs it was necessary to select some arbitrary conditions, especially for the fixed charges, and use the same basic conditions in each municipality.

In the large majority of municipalities the use of these arbitrary conditions was not necessary, the rates containing a fixed charge and a block rate for all consumptions irrespective of appliances used.

Where flat rate water heaters were in operation, a heater of 750 watts was used as representative. The consumption for cooking varies greatly even between customers in the same municipality and where the unit costs vary in different municipalities the consumption for cooking more or less varies inversely with the unit costs. Consequently a cooking consumption which may be fairly representative for the majority of the consumers in one municipality may be too large or too small for those in another municipality. This is also true of water heaters and other appliances, the consumption being governed largely by the unit price. Where service charges were based on two wire or three wire service, the higher charge was used only for the bills for 300 and 500 kilowatt hours. The inclusion of a flat rate water heater of 750 watts would mean a consumption of 540 kw. hrs. if left on continuously for 30 days, and consequently the bill for 500 kw. hrs. in such cases would actually include a somewhat greater consumption. The average consumption, however, is usually less than 540 kw. hrs. and 500 kw. hrs. was considered high enough where metered water heaters were connected.

On September 13, 1939, the Dominion Government imposed a tax of 8 p.c. on all domestic service bills in all provinces. This was removed November 17, 1947. In Quebec and Saskatchewan a provincial tax is in effect, and in British Columbia a Sales Tax of 3 p.c. was imposed on August 1, 1948. A few municipalities also impose a municipal sales tax. Montreal and environs have added a 1 p.c. Education Tax. All such taxes are included in the bills and the tables show where the provincial and municipal taxes apply.

The loads for which commercial lighting and power bills were computed were the billed loads. In some municipalities the billed load was a percentage of the connected load. In other municipalities it was the peak reached over a period, often 30 minutes, and had no direct relation to the connected load, and in others it was the connected load.

A consumption of 200 hours per month would mean 100 per cent use of the load for an average of 8 hours per day for 25 days, and 100 hours use would mean 50 per cent use of the load for the same time. If the billed load were less than the connected load the time or percentage use of the connected load would be correspondingly reduced to produce the same result and the same consumption of electricity.

In all cases the bills were computed for the consumption in kilowatt hours shown in the tables at rates in effect on December 31, 1949.

In practically all cases the commercial light and power bills were computed for unrestricted 24-hour service. A service restricted to 10 hours, from 7 a.m. to 6 p.m., is sold at a lower rate than the unrestricted 24-hour service in many municipalities. The exceptions are indicated by footnotes to the tables. No penalty was included for low power factors and no allowances were made for customers' deposits with the distributor to guarantee payment of bills, or other miscellaneous factors which enter into the bills in some municipalities.

In the column headed "Class of Station" the letters "C" for commercial companies and "M" for municipal or publicly operated systems refer to the distributors which are not in all cases the organizations generating the power, but the letters "H" for hydraulic or water power and "F" for fuel or steam, gas or oil engines indicate the nature of the power used by the generating plant to produce the electricity sold in each municipality. In some cases hydro-electric plants have auxiliary thermal engines used for peak loads or in emergencies, but such plants are classed as hydraulic.

The index numbers of cost of electricity for domestic services were computed by using the bill closest to the actual average bill for each municipality in 1935-39 and weighting them by the average revenue from domestic service in this period. The index numbers for the provinces and for Canada were computed in the same manner using the data for only the municipalities included in this report. The base is the average of the years 1935-1939 = 100.

The commendable practice of making rebates to customers, started in 1943, was adopted in a greater number of municipalities in 1944 and was continued in 1945, but in 1946 to 1948 only one company gave a rebate which was discontinued in 1949. In some cases the rebates represented one month's bill, in some it was an increase in discounts and in others it was a percentage of a year's bills. In all the municipalities where rebates or cancellations of bills were effective they applied to domestic service bills, and in many they applied to both light and power. No deductions for these rebates were made in computing the bills in former reports which are based on the rates in effect on December 31, but in computing the index numbers a deduction of one-twelfth of the rebate or cancelled bill was deducted from the bill for each succeeding twelve months from date of rebate in each municipality affected. This treatment reduced the Provincial and Dominion index numbers even where rates were unchanged. A twelfth was used on the theory that the rebates were based on one year's purchases, and because it was not feasible to restate the previous index numbers the effect was carried forward for a year. These index numbers should not be confused with unit costs; they indicate only the changes in costs to the customers weighted by the total revenue for domestic service received by the distributors, with the average bills of 1935-39 taken as the base. The Dominion tax of 8 per cent in 1939 raised the bills in all provinces by the same proportion and consequently had the same effect on all index numbers irrespective of the unit prices. The cancellation of the tax in 1947 had the reverse effect on the index numbers, while the 3 p.c. sales tax imposed by British Columbia in 1948 increased the provincial index from 99.67 to 102.28.

Rate increases during 1949 were reported for New Waterford, Sydney and Truro in Nova Scotia, Moncton in New Brunswick and in the province of Quebec in Ste. Agathe and Sherbrooke where the rate of discount was dropped from 10 to 3 p.c., Rimouski where a 2 p.c. municipal sales tax was added and in Montreal, Verdun, Outremont, Lachine and Westmount a 1 p.c. Education Tax authorized by Chapter 75 Statutes of Quebec 13 George VI 1949, was applied. (See also Chapter 21, Statutes of Quebec 10 George VI, 1946). The Hydro-Electric Power Commission of Ontario power rates were changed from a Horse Power to a Kilowatt base which made but slight changes in power bills.

The cost of domestic electricity index is unique in that despite higher costs for practically everything else in the family budget, this index for Canada was only 85.67 at the end of 1949 against 103.25 at the end of 1939, a decline of 17.1 p.c., whereas the cost of living index, of which it is a component, rose from 103.8 in December, 1939, to 161.6 at the end of 1949, up 55.7 p.c. In the United States, the domestic electricity index on the same base stood at 90.3 on December 15, 1949 compared with 95.8 at the similar date of 1939, down only 5.2 p.c. Their cost of living index rose from 99.6 to 167.5 in a like comparison.
