SYMBOLS

The interpretation of the symbols and abbreviations used in the tables throughout this publication is as follows:

.. figures not available.

... figures not appropriate or not applicable.

- nil or zero.

DC in frequency column, indicates direct current equipment.

R following date of manufacture indicates unit of equipment rebuilt at that date.

S after main generator indicates generator on standby.

SIGNES CONVENTIONNELS

Les signes conventionnels et les abréviations qui ont été utilisés dans tous les tableaux de la présente publication doivent être interprétés comme suit:

.. nombres indisponibles

... n'ayant pas lieu de figurer.

- néant ou zéro.

DC dans la colonne des fréquences indique qu'il s'agit de matériel à courant continu.

R à la suite de la date de fabrication indique qu'il s'agit de matériel remis à neuf à cette date.

S après générateur principal indique générateur en réserve.

INTRODUCTION

The compilations for this edition of the Inventory of Prime Mover and Electric Generating Equipment were produced on a computer using simulation programming. The computerization of this report necessitated the extensive use of abbreviations and codes. A list of these abbreviations and codes, together with explanatory notes may be found on Page 7. It also should be noted that because of space limitations all data have been rounded to the nearest whole number, hence 125.7 will appear as 126. The survey for this report was conducted by Statistics Canada with the cooperation of the Canadian Electrical Association and various federal government departments. It endeavours to provide a detailed listing of prime movers and generating equipment installed as at December 31, 1972. Survey coverage is limited to those utilities and companies which have at least one plant with a total generating capacity of over 500 kw. and is exclusive of auxiliary equipment installed only for generating station service.

Plants operated by each utility or company are listed alphabetically and the generator units are listed in chronological sequence.

Between the two world wars, three editions of a Directory of Central Electric Stations were produced by the Dominion Water Power and Reclamation Service of the Department of the Interior in collaboration with the Dominion Bureau of Statistics. In this directory, both the equipment and the service provided by electric utilities and companies which sold part of their generation were described in considerable detail but no information was provided on industrial plants which produced electric energy solely for own use. Also, no information was obtained from plants located in what is now the Province of Newfoundland. The last of these directories was published in 1928, although a supplement was issued in 1936.

In 1937, the Dominion Bureau of Statistics produced a mimeographed list of "Power Plants of Large Central Electric Stations". This list grouped hydro and thermal plants by province and company showing their total horsepower capacity and precise geographic location.

Previous reports titled "Inventory of Prime Mover and Electric Generating Equipment" were published for 1958, 1961, 1966 and 1969. Beginning with the 1971 edition, this report is published on an annual basis.

Les opérations qui ont permis d'établir la présente édition de l'Inventaire des moteurs primaires et des générateurs électriques ont été effectuées sur ordinateur, par un programme à modèle simulé. L'automatisation de la publication a nécessité le recours intensif à des abréviations et à des codes. Une liste de ces abréviations et de ces codes, suivie de notes explicatives, est à la page 7. Il faut également noter que le manque de place nous a amenés à arrondir toutes les données au nombre entier le plus rapproché, ainsi pour 125.7 on donnera 126. L'enquête qui a servi à cette publication a été effectuée par Statistique Canada avec la collaboration de l'Association canadienne de l'électricité et divers ministères fédéraux. On s'applique à fournir une liste détaillée des moteurs primaires et des générateurs électriques installés au 31 décembre 1972. La couverture de l'enquête se limite aux services d'utilité et aux sociétés ayant au moins une centrale dont la puissance génératrice totale dépasse 500 kW. et ne comprend pas le matériel auxiliaire installé exclusivement au profit des centrales génératrices.

Les centrales exploitées par les divers services d'utilité et les diverses sociétés figurent dans l'ordre alphabétique, et les générateurs figurent dans l'ordre chronologique.

Entre les deux guerres mondiales, trois éditions d'un répertoire des centrales électriques ont été publiées par le service fédéral responsable de l'énergie hydro-électrique au ministère de l'Intérieur, en collaboration avec le Bureau fédéral de la statistique. Ce répertoire décrivait d'une manière très détaillée le matériel des services d'utilité et des compagnies qui vendaient une partie de l'énergie qu'elles produisaient, de même que les services assurés par ces entreprises. Cependant il ne comportait aucun renseignement au sujet des centrales industrielles qui produisaient de l'électricité pour leur usage exclusif. Aucun renseignement ne parvenait de ce qui est devenu la province de Terre-Neuve. Le dernier de ces répertoires a paru en 1928, bien qu'un supplément a été publié en 1936.

En 1937, le Bureau fédéral de la statistique a établi une liste polycopiée qui énumérait les usines productrices des grandes centrales électriques. Cette liste groupait les centrales hydro-électriques et thermiques par province et par société, et indiquait leur capacité totale de production en cheval vapeur ainsi que leur emplacement exact.

Auparavant, sous le titre Inventory of Prime Mover and Electric Generating Equipment, des publications hors série ont paru en 1958, 1961 et 1966, et un dernier rapport sous le titre "Inventaire des moteurs primaires et des générateurs électriques" a paru en 1969. Commençant avec l'édition de 1971, ce rapport est publié à chaque année.

HEADING EXPLANATIONS AND NOTES

EXPLICATION DES TITRES ET DES NOTES

Hydro Equipment

PLANT NAME — where the plant has no official name, a name (usually the same as its location) has been assigned

WATER SUPPLY — name of lake, creek, river or reservoir

CO-ORDINATES — geographical co-ordinates
LAT LONG latitude longitude

OPERATING HEAD IN FEET — operating head given in feet, the average annual maximum, minimum and normal

AV AN FLOW CFS — average annual flow through the turbines in cubic feet per second

YEAR — year of installation — only last two digits are given, e.g. 63 = 1963

MFR — manufacturer

RUN-NER — see Codes page 10

RPM — revolutions per minute

HEAD — design head given in feet

HP — horsepower

MOMENT OF INERTIA — in millions of pounds-feet²

FREQ — frequency

KVA — kilovolt-amperes

POWER FACTOR — expressed as a per cent

KW — kilowatts

Centrales hydro-électriques

NOM DE LA CENTRALE — lorsque la centrale n'a pas de nom officiel, on lui a affecté un nom (le plus souvent, celui de l'emplacement)

SOURCE HYDRAULIQUE — nom du ruisseau, du fleuve, de la rivière ou du réservoir

COORDONNÉES LAT LONG — coordonnées géographiques latitude longitude

HAUTEUR DE CHUTE EN PIEDS MAXI MINI NORM — hauteur de chute en pieds, moyenne annuelle maximum, minimum et normale

DÉBIT ANNUEL MOYEN — débit annuel moyen, en pieds cubes par seconde

AN-NÉE — année d'installation, deux derniers chiffres seulement (63 = 1963)

FAB — fabricateur

TUR-BINE — voir Codes page 10

T/MN — nombre de tours à la minute

HAUT DE CHUT — hauteur théorique de chute, en pieds

HP — puissance en cheval vapeur

MOMENT D'INERTIE — en millions de livres-pieds carrés

FREQ — fréquence

KVA — kilovolts-ampères

FACT PUISS — facteur de puissance, exprimé en pourcentage

KW — kilowatts

Steam Equipment

PLANT NAME — where the plant has no official name, a name (usually the same as its location) has been assigned

CO-ORDINATES — geographical co-ordinates
LAT LONG latitude longitude

YEAR — year of installation — only last two digits are given, e.g. 63 = 1963

MFR — manufacturer

STEAM PSIG F — steam conditions shown in pounds per square inch gravitational and degrees Fahrenheit

Centrales thermiques à vapeur

NOM DE LA CENTRALE — lorsque la centrale n'a pas de nom officiel, on lui a affecté un nom (le plus souvent, celui de l'emplacement)

COORDONNÉES LAT LONG — coordonnées géographiques latitude longitude

AN-NÉE — année d'installation, deux derniers chiffres seulement (63 = 1963)

FAB — fabricateur

VAPEUR PSIG F — pression dynamique de la vapeur en livres par pouce carré et température en degrés Fahrenheit

REVIEW OF SURVEY RESULTS

Total installed generating capacity in Canada as at December 31, 1972 was 49,943,683 kw., an increase of 7.0 % over the 46,675,733 kw. recorded a year earlier. Installed capacity was higher for all provinces and for all types of generating stations. Increases by type of prime mover were: hydro 1,898,924 kw. (6.2 %); steam, 1,340,310 kw. (9.2 %); internal combustion, 2,616 kw. (0.5 %) and gas turbines, 26,100 kw. (2.7 %).

In the hydro sector, installed generating capacity rose to 32,500,023 kw. from 30,601,099 a year earlier. Churchill Falls (Labrador) Corporation Limited accounted for slightly more than half the total gain with the addition of two generating units totalling 950,000 kw. at Churchill Falls. The British Columbia Hydro and Power Authority was responsible for an increase of 504,000 kw. in installed hydro capacity with the opening of their 50,000 kw. Whatshan station in 1972 and the addition of two 227,000 kw. units at Gordon M. Shrum.

The installed generating capacity of steam plants increased from 14,585,475 kw. in 1971 to 15,925,785 kw. in 1972. The Hydro Electric Power Commission of Ontario increased the generating capacity of their Pickering nuclear installation by 540,000 kw. and added a 500,000 kw. generating unit at the Nanticoke conventional steam plant for a total increase of 1,040,000 kw. over 1971.

The following table gives further comparisons between provinces, types of generators and types of ownership. In addition, a list of hydro plants and steam plants with a generating capacity of 100,000 kw. or over appears on page 16.

REVUE DES RÉSULTATS DE L'ENQUÊTE

En date du 31 décembre 1972, la puissance génératrice installée au Canada était de 49,943,683 kW, soit 7.0 % de plus que le total de 46,675,733 kW enregistré l'année précédente. Toutes les provinces ont connu une hausse dans la capacité génératrice comme l'ont fait également chacun des quatre types de centrales génératrices. Les augmentations par type de moteurs primaires étaient: hydro-électrique, 1,898,924 kW (6.2 %); thermiques à vapeur, 1,340,310 kW (9.2 %); combustion interne, 2,616 kW (0.5 %) et turbine à gaz, 26,100 kW (2.7 %).

Dans le secteur hydro-électrique, la puissance génératrice installée s'est élevée à 32,500,023 kW en 1972 comparativement à 30,601,099 kW un an plus tôt. La Churchill Falls (Labrador) Corporation Limited a ajouté deux générateurs d'une puissance totale de 950,000 kW à Churchill Falls. Cette augmentation représente un peu plus que la moitié du gain total dans ce secteur. La British Columbia Hydro and Power Authority a contribué 504,000 kW d'augmentation à la puissance hydro-électrique totale, ayant augmenté de 454,000 kW la puissance génératrice de Gordon M. Shrum et ouvert, en 1972, la centrale Whatshan d'une puissance génératrice de 50,000 kW.

La puissance génératrice installée des centrales thermiques à vapeur est passée de 14,585,475 kW en 1971 à 15,925,785 kW en 1972. La Hydro Electric Power Commission of Ontario a augmenté de 540,000 kW la puissance génératrice de la centrale nucléaire de Pickering et en plus a ajouté une installation de 500,000 kW à Nanticoke pour un gain total de 1,040,000 kW comparativement à 1971.

Le tableau suivant présente des comparaisons plus détaillées entre les provinces, les types de générateurs et les catégories d'entreprises. En plus, une liste des centrales hydro-électriques et des centrales thermiques à vapeur ayant une puissance génératrice de 100,000 kW ou plus se trouve à la page 16.
