## BANK DEBITS IN 1941.

The sum of the cheques cashed in clearine centres throughout Canada showed a continuance of the upward trend during the year under review. The total of \$39,243 million represented a gain of $14 \mathrm{p} . \mathrm{c}$. over the $\$ 34,457$ million cashed during 1340 and was more than $24 \mathrm{p} . \mathrm{c}$. freater than the amount for 1939. The increase in debits exceeded that shom by severai other baroneters of economic conditions. The index of the physicul volume of business rose $11.1 \mathrm{p} . \mathrm{c}$. from $1 ? 1.1$ to 134.6 , with the index of industrial moduction rising 10.4 v.c. to 143.0 . General employment, however, recorded a much greater increase than any of these factors. The average standing for 1941 was 152.3 or $22.6 \mathrm{p} . \mathrm{c}$. greater than during the preceding yeur, with the gain in manufacturing employment being of even larger proportions.

Wholesale prices rose $8.4 \mathrm{p} . \mathrm{c}$. during the year under review, the steady advance of the precedine year being just about maintained. Sriall monthly advances continued up to the end of the year. Comon stock prices showed decline, fulling off 12.8 p.c. fron 1940. Capitalized bond yields showed a gain of 5 p.c., the average index for 1941 on the base of 1935-1939 standing at 104.8.

The total volume of bani: debits rose in all five economic areas. Ontario recorded the largest increase of 18.4 p.c. British Columbia and the Maritime Provinces advanced in about the same ratio as the Dominion, with quebec rising by $11 \mathrm{p} . \mathrm{c}$. and the Prairie Provinces by $7.7 \mathrm{p} . \mathrm{c}$.

Fairly uniform increases were recorded in each of the three Maritime clearing centres. In quebec, the Montreal total showed a rise of nearly $14 \mathrm{p} . \mathrm{c}$., but the provincial agtrogate was lowered by the recession in quebec city.

Each of the established Ontario cleuring centres recorded advances, the creation of a new centre at St. Catherines further increasing the provincial total. Ottawa, again showed the larest relative increase, rising by j2 per cent fron *2,191 million to $\$ 3,334$ million, largely due to the expansion of governmental activities. Gains of over $50 \mathrm{p} . \mathrm{c}$. were also recoided by Hamilton and Windsor, among the more important centres. The gain in Toronto was 3 p.c., the total increase for the province amounting to $\$ 2,830 \mathrm{million}$.

The highest percentage gain in the Prairie Provinces was recorded by Prince Albert, at 35.8 p.c. Caigary led the larger centres with a rise of $20.9 \mathrm{p} . \mathrm{c}$. Winnipeg showed the greatest actuul advance, but the percentuge increase was only 4.3. Each of the ten clearing centres in this area posted higher totals than in 1940. The gain for the economic area as a whole was $\$ 473$ million.

Ail three centres showed advances in British Columbia with the Vancouver dedits rising by $13.9 \mathrm{p} . \mathrm{c}$.

Toronto again led in amount of cheques casned, with a greater increase over 1940 being recorded by Montreal. The Toronto total was \$il, 354.8 miJlion , the Montreal aggregate being $\$ 3,304.3$ million. The sum of debits in Minnipeg was \$4,011.3. Ottawa, Vancouver, Hamilton and Quebec were other centres with average debits of over a billion dollars each.

## II. CAMADA'S EQUATION OF EXCHANGE I921-1941.

Total checue payments in clearing centres rose by about $14 \mathrm{p}, \mathrm{c}$. during 1941, standing at $\$ 39,243$ millior as comared with $\$ 34,437.5$ million in the preceding yeur. The total number of cleurine centres vas raised to thirty-three by the inclusion of St. Catherines. Payments by checque for the Dominion as a whole estimated by adding 12.5 p.c. for transactions outside of clearing centres were $\$ 44,143.4$ million in the year under review as compared with $\$ 38,742$. in 1340. Curroncy in circulation during last year probably amounted to about $\$ 342$ million, somewhat higher than the total for 1940. Cash payments, however, appear to have been much greater in i $\hat{3} \leqslant 1$ than curing the preceding year, and also far above the record established in 1929. Aggregate cash and cheque payments were set at $\$ 51,065$ million as compared with $\$ 44,211$ million in 1340 .

Bank deposits posted a further substantial increase in the year under revien, rising from $\$ 2,743$ million in 1940 to $\$ 3,026$ million. Demand deposits recorded a marked gain, and those held by the Dominion Govewament, rose by more than 50 p.e. Notice deposits fell off somewhat. The rate of turnover of bank deposits remained very moderate rising to 14.54 as compared with 14.09 in 1940 . Total deposits are now at a far higher level than at any other period, and even with cash and cheque transactions expanding at their present rate, the velocity of the deposits is still relatively low.

The following tables bearing on the equation of exchange in Canada for tine last twenty-one years ray be of interest. The equation takes the form of MV + $M_{1} V_{l}=P T$. M signifies the amount of circulating media in the hands of the public. $V$ is the velocity of the money in circulation or the number of times the redia is used in making payments. WV consequently signifies the total amount of cash payments within a stated period.
$M_{1}$ sienifies the amount of the banis deposits and $V_{I}$ the velocity or turnover of such deposits. The symbol $M_{1} V_{1}$ stands for the total amount of payments by cheque against individual accounts during a given period. In the present stidy, the year is taken as the unit.

On the other silue of the equation, PT symbolizes the ingex of the estimated national income.

## Method of Compilation

Bank notes in the hands of the public were obtained by deducting the "notes held by other bank" from the total circulation of bank notes. Previous to March 1935, Donlnion notes in the possession of the banks and the central gold reserves were deducted from the total issue of such notes. For the last nine montis of 1935, the holdings of the chartered banks of Bank of Canada notes were deducted from the total amount of such notes outstanding. This method was continued in subsequent years.

The amount of subsidiary coin held by the Bunk of Canada and the chartered banks in Canada is reported monthly. The outstanding silver, nickel and bronze coins at the cnd of each year are reported by the Mint. The average bank holdings were deducted from the outstanding coin to obtain the amount in the hands of the public.

Adaing the notes and subsidiary coin items obtained, we have the amount of circulating media in the hands of the public.

$M_{1} \quad$ The sum of the Dominion and provincial government deposits and the notice and demand deposits in Canada is regarded as $M_{1}$ i.e. deposit liabilities of the banks subject to cheçue. The average of the twelve month-end totals was used as annual data.
$M_{1} V_{1} \quad$ Bank debits as published by the Bureau are available from January, 1324 for thirty-two clearing centres. By using bank clearings and a constant, determined by the relationship between clearings and debits, banic debits were interpolated for the period from January 1919 to December, 1923. By a test made ior January 1335, it was found that cheques cashed outside of clearing centres amounted to per hotathe published totals. Adding $12 \frac{1}{2}$ per cent to cleuring-house returns, e series roughly equivalent to $M_{I} V_{I}$ is obtained.
$V_{1}$ Upon dividing bank debits plus the $12 \frac{1}{2}$ per cent, by bank deposits, we ascertain the velocity of deposits, the $V_{l}$ of the equation.

V As no statistics are available shoving the amount of roney paid into the chartered banks during any. given period, it is impossible to directly obtain the velocity of circulating media in the hands of the public.

It is inferred from experience in the United Staies that the turnover of noney is about lê. 5 per cent greater than the turnover of deposits. The estimated velocity of money in the United Statess from 1396 to 1309 vas nearly 21 according to statistics given in Ir过g Fisher's "Purchasing Power of Money". The average turnover of deposits in Canada from 1919 to 1339 was 17.5. The tumover of money on this basis was regarded as being 13.5 per cent greater than thit ol deposits. Trese assumptions admittedly involve a margin of error, but money payments play a small part in comparison $\pi$ ith cheque payments and the resulting error in total pyyments is not regarded as important.

MV
Nultiplying the circulating media in the hands of the puilic by the velocity, the total cash payments were obtained. Total payments by cash and cheque, MV + $\mathrm{M}_{1} \mathrm{~V}_{1}$, were obtained in millions of dollars by addition, the results beine shown in Table 4.

A detailed study of the national income during the inter-mar period has been carried to the point justifying the publication of the totais. The national income estimates, embrucing in terms of value the entire economic activities of the Dominion, should correlate with the sum of cheque and cash payments.

As stated, statistics of bank debits as published in this bulletin are limited to returns from clearing house centres only. For the purpose of establishing the ratio of the debits in clearing contres to the totill amount of debits charged to all accounts at all branch banks in canada in a particular month, a special enquiry was made by the Canadian Bankers ${ }^{3}$ Association in regard to the amount of bank debits charged to accounts at branch banks outside of clauring house centres during Junuary 1935. It was ascertained that the total debits outside of clearing house centres were in that month only 22.5 per cent of the debits in clearing centres.

The main factors in the equation of exchange are show by years during the period from 1321 to the present in Tables 6 to 9.
