### SYMBOLS

The interpretation of the symbols used in the tables throughout this publication is as follows:

- .. figures not available.
- nil or zero.
- amount too small to be expressed or where "a trace" is meant.

### NOTES

1. This report contains historical data and supersedes previous reports.
2. Due to rounding, tabular detail in this report may not add to totals.

# SURVEY OF PRODUCTION

1960

## INTRODUCTORY NOTE

Owing to the fact that the classification of establishments was revised for the year 1960 in accordance with the latest Standard Industrial Classification Manual (DBS Catalogue no. 12-501), the figures for net value of production in certain industries in that year are not comparable with those in previous years. Manufacturing and mining are particularly affected by this revision, although there will be minor changes in forestry and agriculture.

It is planned to carry these revisions back to the year 1957. Since these tabulations have not all been completed for the earlier years, the data are shown in the tables on an unrevised basis. The revised data for mining are included in a footnote to Table 1; revisions to other industries will be included in the next report. It is not expected that these classification changes will significantly affect historical comparisons of data shown in this report.

### 1. Trends in Commodity Production

Value added<sup>1</sup> in Canadian commodity-producing industries reached a record high during 1960 of \$19,220,000,000, 2 per cent above the 1959 level of \$18,839,000,000. All provinces with the exception of Ontario, which declined fractionally, contributed to this gain. Owing to the change in classification in 1960, precise comparisons with previous years are not possible for certain industries.

In a review of 1960 data the contribution of individual industries to the total varied from 55 per cent for manufacturing to less than one-half of one per cent for trapping. Construction ranked second in importance in 1960, contributing 19 per cent to the total. Agriculture followed with a contribution of 10 per cent and mining 8 per cent. Electric power and forestry each contributed 4 per cent to total net value and fisheries contributed one-half of one per cent.

Manufacturing has maintained its position over the years as the leading commodity-producing industry in Canada, contributing more than one-half of the net value of commodity production in most years. Construction has ranked second in importance in the last six years, having taken over this position from agriculture in 1954. Mining has increased in relative importance in recent years due to the sharp advances in the output of iron ore, uranium, petroleum and natural gas. The contributions of electric power and forestry have varied from 3 to 6 per cent over the period. Fisheries has contributed about one per cent to the total.

<sup>1</sup> Census value added is obtained by deducting from gross value of production, exclusive of excise and manufacturers' sales taxes, the cost of purchased materials, fuel and electricity; census value added still includes purchased services and certain indirect taxes such as licences, property taxes, public domain taxes on oil and gas extraction, etc. In the remainder of this report, value added will be referred to as 'net value'.

The net value of production for commodity-producing industries in Canada and the provinces is presented historically in Chart 1, in order to show the growth of production since 1935. The provinces Alberta, British Columbia and Saskatchewan have increased at a more rapid rate than Canada, while Ontario and Quebec show growth rates similar to Canada. The remaining provinces reflect lesser growth rates but for the most part have maintained the same position relative to each other. During the last decade Ontario has maintained the leading position in commodity production, contributing over 40 per cent to the Canadian total in each year. In the same comparison, Quebec ranked second in importance with a contribution of 26 per cent to total net value. In third position was British Columbia with a contribution varying from 9 to 11 per cent. The same relative positions have been maintained by the Prairie provinces in most recent years with Alberta contributing 7 to 8 per cent, Saskatchewan 4 to 7 per cent and Manitoba 4 to 5 per cent of net value. The contributions of individual Atlantic provinces have ranged from 0.2 to 2.4 per cent of the total for Canada.

The net value of commodity production is presented historically by province and leading industries in Charts 2 to 10. Agriculture was the leading industry in Saskatchewan, Alberta and Prince Edward Island, while manufacturing held the lead in all but one of the remaining provinces. The exception was Manitoba where the leading position varied between manufacturing and agriculture over the period. Construction was high in relative importance in all provinces and showed the most rapid rate of growth of all commodity-producing industries, in every province over the period covered.

### 2. Outlook for 1961

Preliminary data now available suggest that the net value of commodity-producing industries in 1961 was up slightly from 1960 levels. Manufacturing shipments and inventory data suggest about a 3 per cent increase in the value of manufactures in 1961 as compared with 1960. Construction increased 2 per cent with increases in all provinces except Prince Edward Island, Nova Scotia, New Brunswick and Manitoba. Preliminary data also indicate that fishing, mining and electric power increased while forestry and trapping decreased. Agriculture was down 18 per cent with Manitoba and Saskatchewan severely affected by poor grain crops. All other provinces, with the exceptions of the Atlantic provinces, reflected increased net values of agriculture.

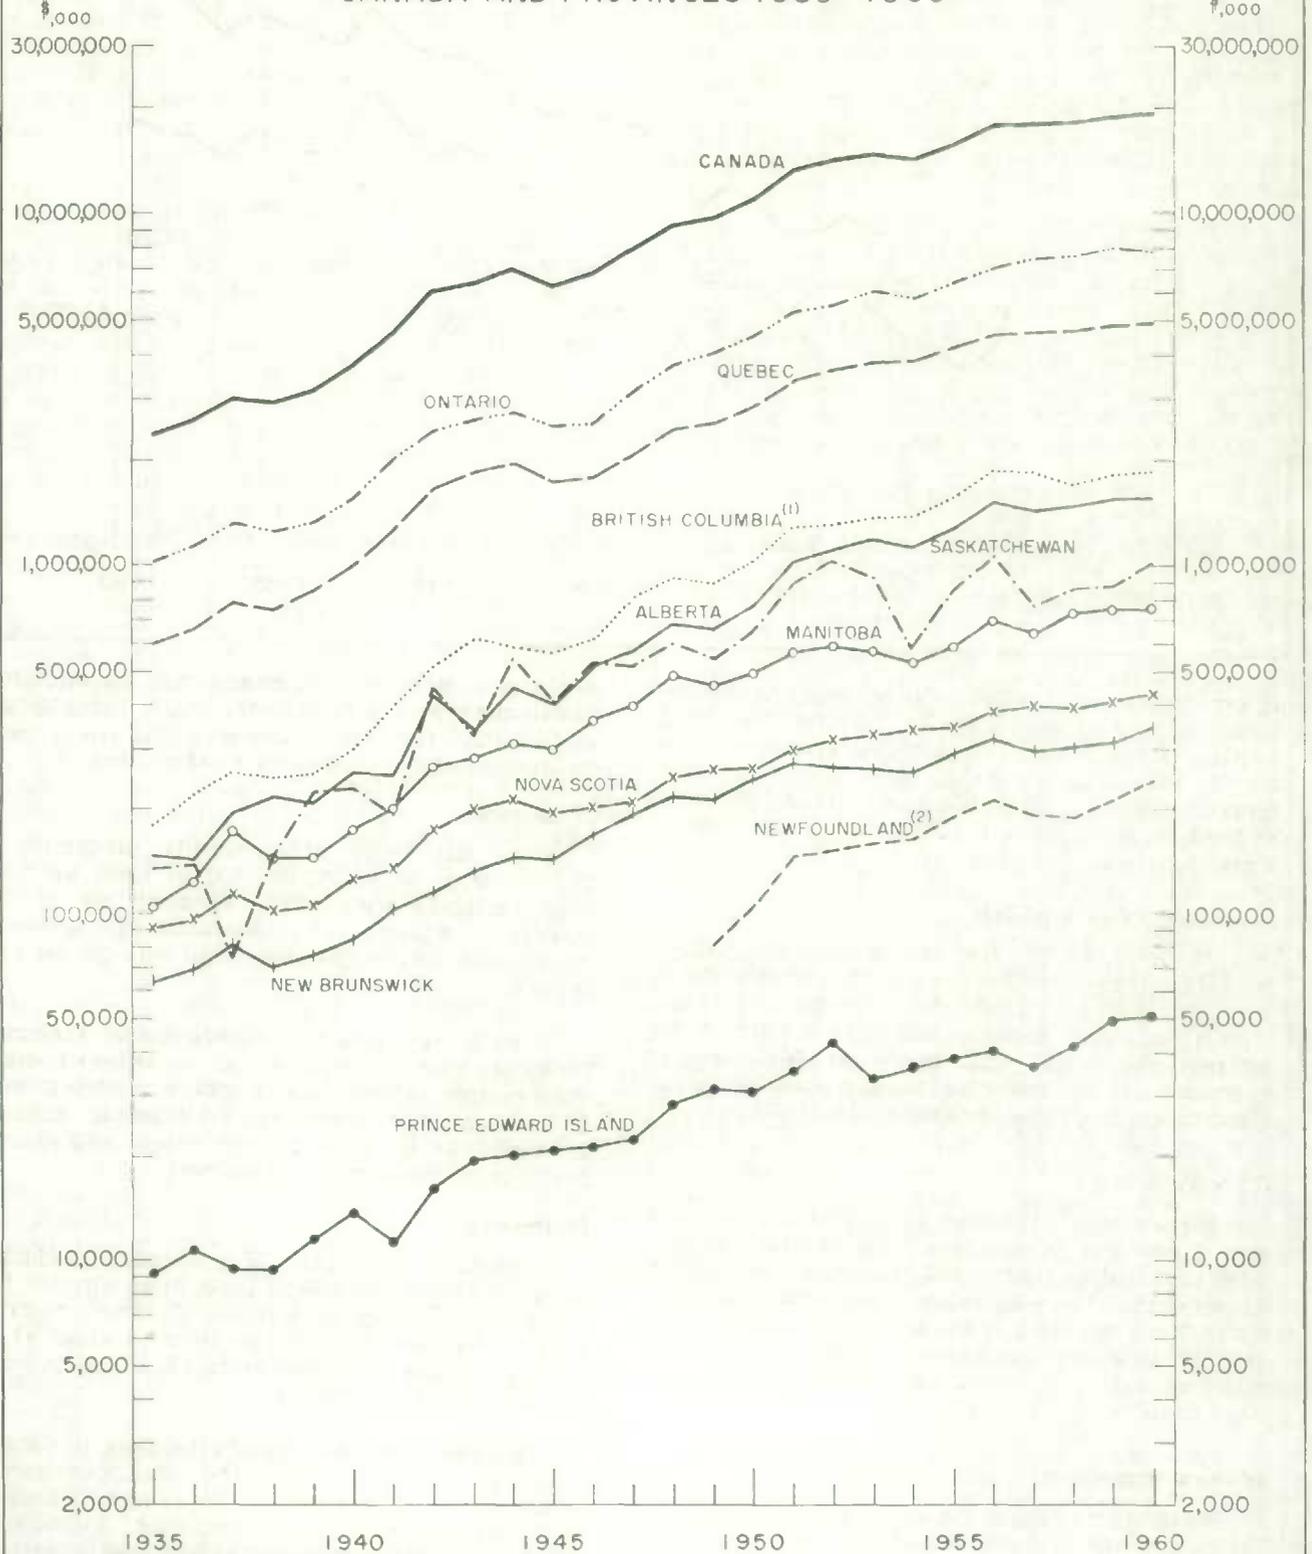

### 3. Provincial Analysis of Production

#### (a) Newfoundland

Newfoundland's net value of commodity-producing industries exclusive of agriculture, amounted to \$243,000,000 in 1960 an increase of

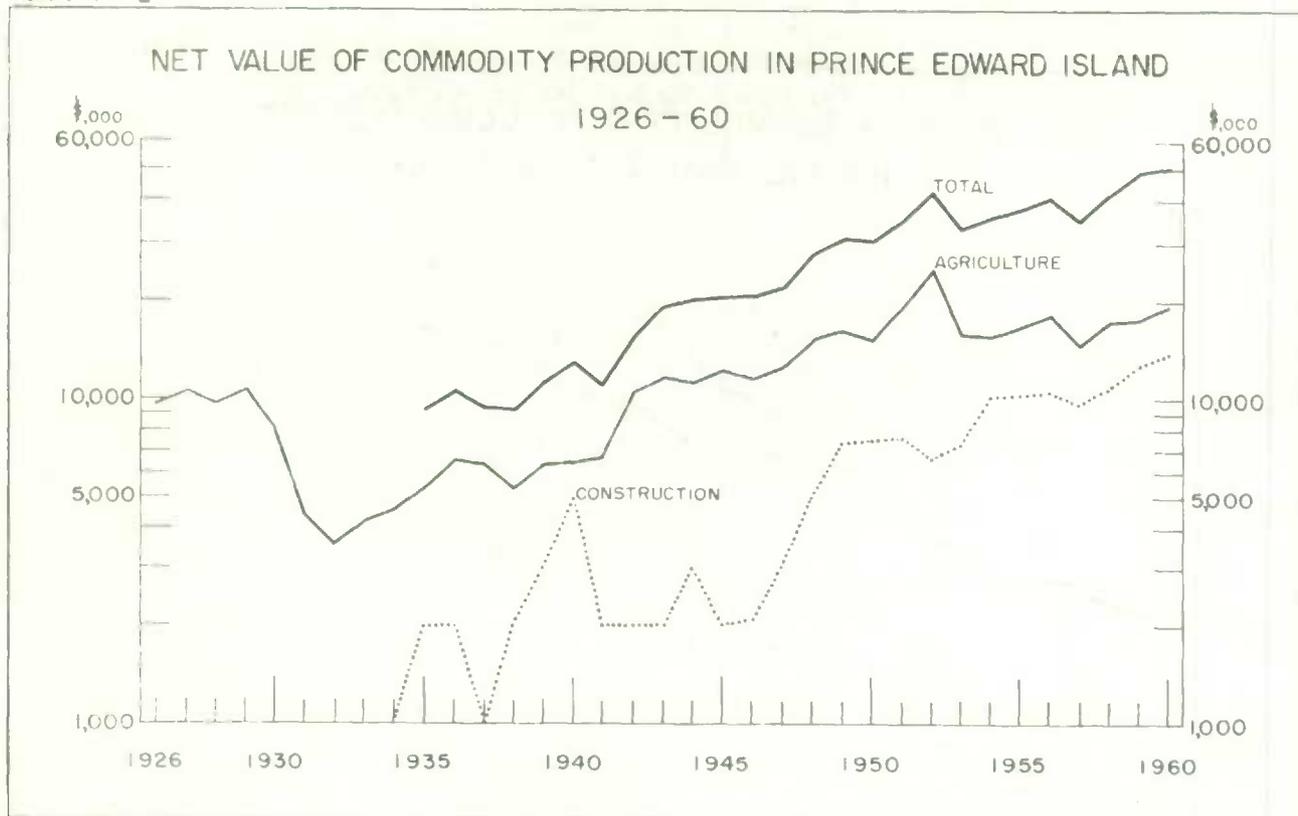

CHART - 1

NET VALUE OF COMMODITY-PRODUCING INDUSTRIES  
CANADA AND PROVINCES 1935-1960

(1) CONSTRUCTION FIGURES FOR YUKON AND NORTHWEST TERRITORIES ARE INCLUDED WITH BRITISH COLUMBIA.  
(2) NEWFOUNDLAND DATA EXCLUDE AGRICULTURE.

CHART - 2

15 per cent over 1959. The contribution of Newfoundland to the Canadian total is slightly more than 1 per cent. Construction and manufacturing, the leading industries, accounted for 31 and 27 per cent respectively of the total net value. Mining followed with 20 per cent, forestry 12 per cent, and fisheries 7 per cent.

**(b) Prince Edward Island**

The net value of commodity-producing industries in Prince Edward Island stood at \$50,000,000 in 1960, virtually unchanged from the previous year. Agriculture, the leading industry accounted for 39 per cent of the total value in 1960. Next in importance were construction and manufacturing, contributing 29 and 17 per cent respectively.

**(c) Nova Scotia**

Nova Scotia's net value of commodity production rose 5 per cent in 1960 to a level of \$431,000,000. The principal industry, manufacturing, contributed 41 per cent to the total value. Construction followed with 27 per cent, while mining, Nova Scotia's main primary industry, contributed 11 per cent to the total net value of output. Agriculture and fisheries each contributed 6 per cent.

**(d) New Brunswick**

In 1960 New Brunswick's net value of commodity production was \$347,000,000 some 10 per cent above the 1959 aggregate. Manufacturing, the leading industry, accounted for 46 per cent of total net value

of output. Next in importance was construction, contributing 24 per cent to the total. Forestry and agriculture, the main primary industries, each contributed 10 per cent to the total in 1960.

**(e) Quebec**

The net value of commodity production in Quebec stood at \$4,955,000,000 in 1960, up 3 per cent compared with 1959. Virtually all of this increase occurred in manufacturing. Quebec's contribution to the Canadian total was 26 per cent in 1960.

The leading industry, manufacturing, accounted for 64 per cent of the provincial net value of output. Construction ranked second with a contribution of 17 per cent. Agriculture, the main primary industry accounted for 6 per cent while mining and electric power each accounted for 5 per cent.

**(f) Ontario**

Ontario's net value of commodity production stood at \$7,960,000,000 in 1960, down slightly from the preceding year. As a result, Ontario's contribution to the Canadian total declined to about 41 per cent. Decreases were concentrated in mining, manufacturing and construction.

Manufacturing, the leading industry in Ontario, contributed 67 per cent to the total. Construction followed with 15 per cent. Of the primary industries, agriculture contributed 7 per cent, followed by mining and electric power with 6 and 4 per cent respectively.

CHART - 3

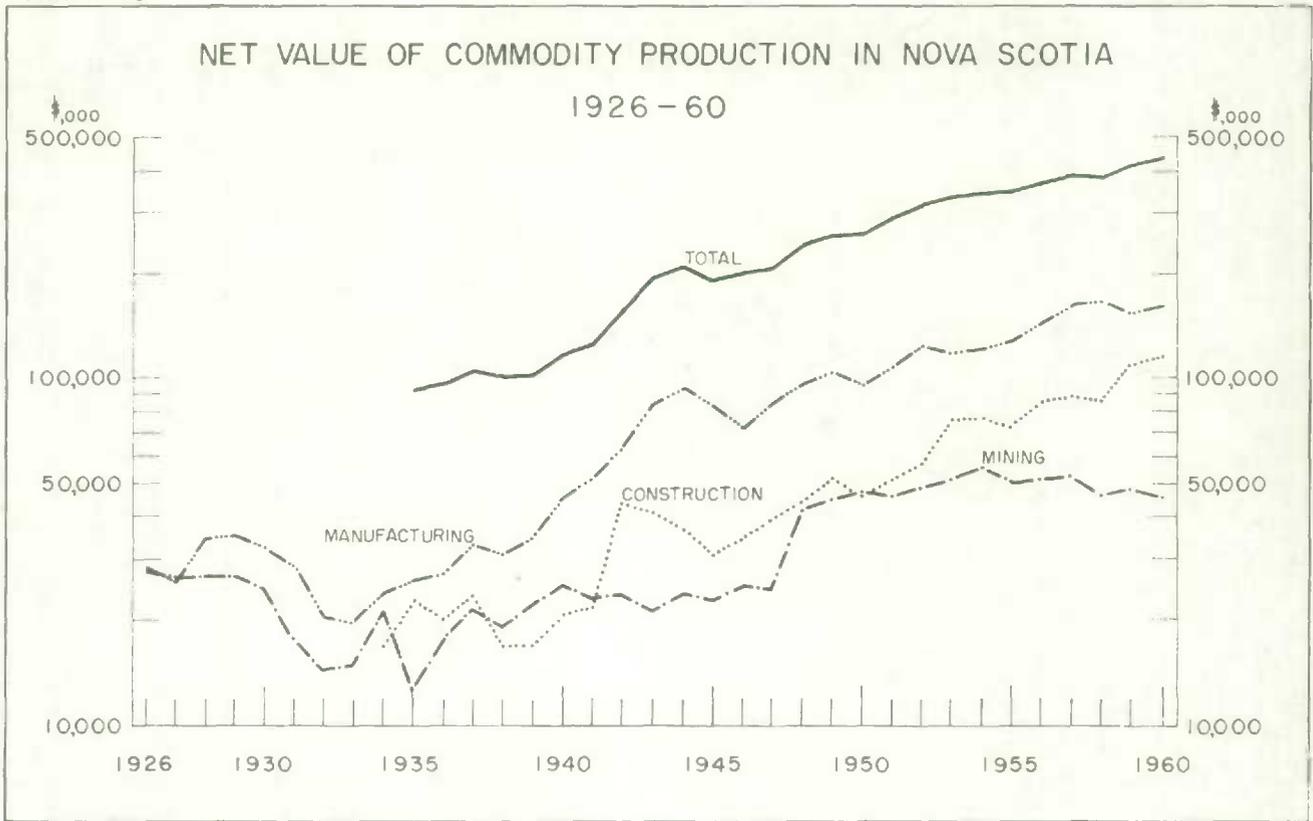

CHART - 4

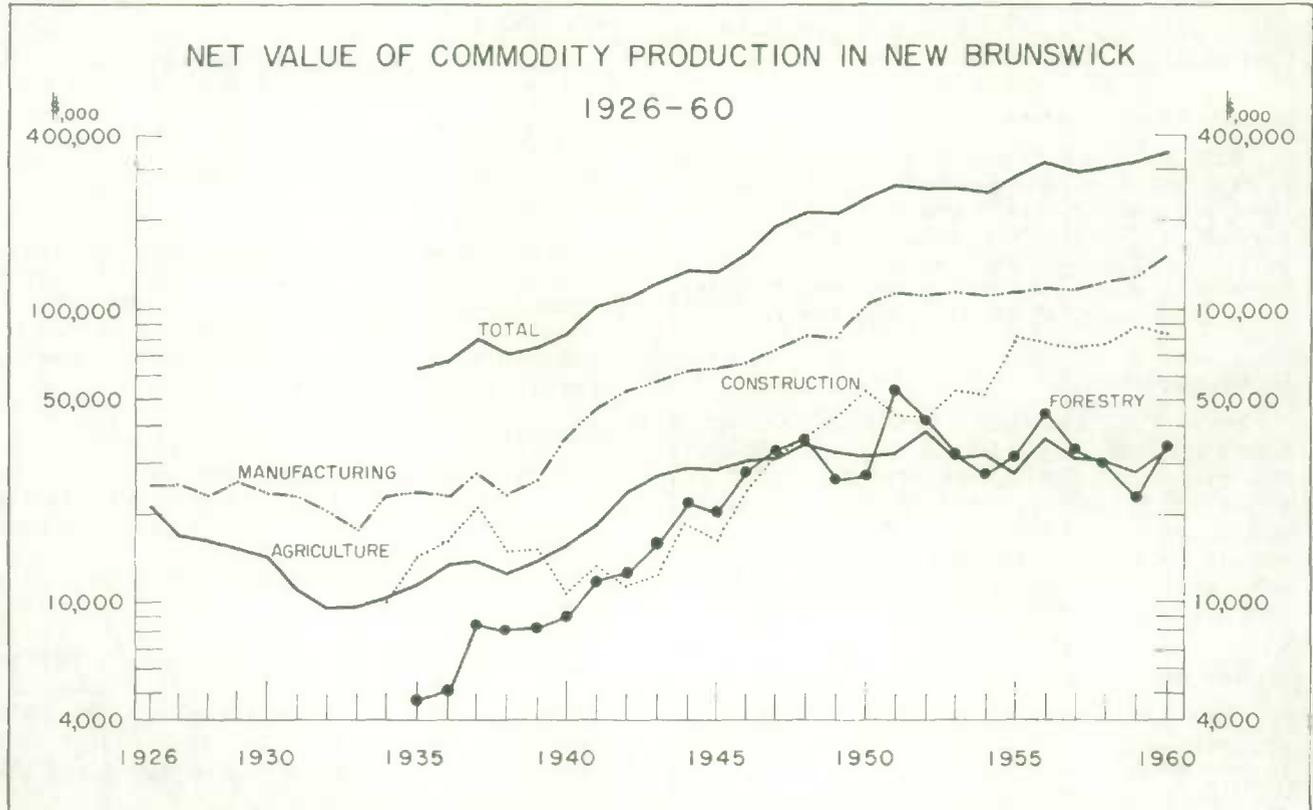

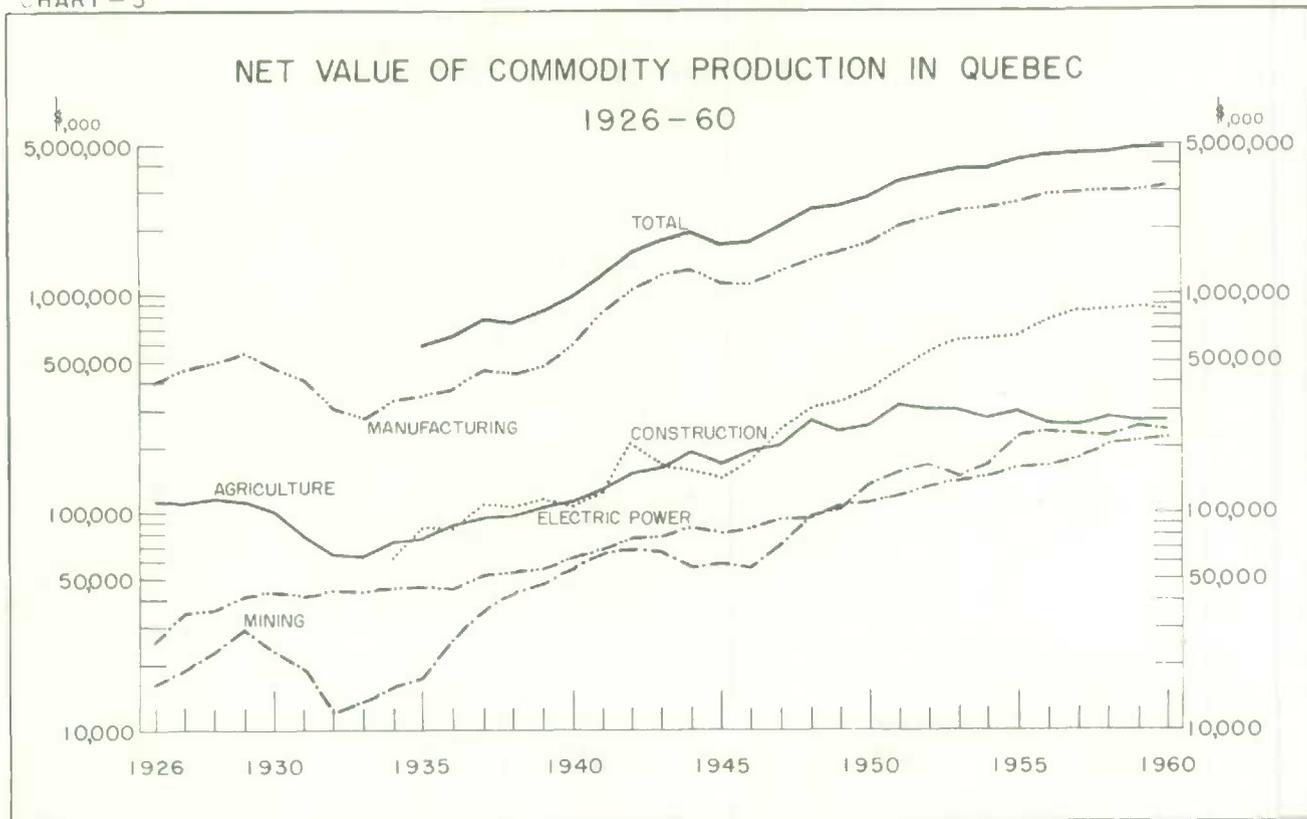

CHART - 5

**(g) Manitoba**

The net value of commodity production in Manitoba rose fractionally to \$747,000,000 in 1960. Manufacturing, the leading industry, contributed 41 per cent to the provincial total. Second in rank was construction, contributing 27 per cent of the total. Agriculture, the main primary industry, accounted for 23 per cent.

**(h) Saskatchewan**

Saskatchewan's net value of commodity production rose to \$1,023,000,000 in 1960, up 16 per cent, due to a \$139,000,000 gain in agriculture. The main industry, agriculture, accounted for 50 per cent of the provincial total value. Construction and mining contributed 19 and 16 per cent respectively while manufacturing contributed 12 per cent.

**(i) Alberta**

The net value of goods-producing industries in Alberta totalled \$1,566,000,000 in 1960, virtually unchanged from 1959.

Alberta's contribution to the Canadian total in 1960 was 8 per cent, the fourth in rank among the provinces. Construction accounted for 28 per cent of the total followed by mining and manufacturing

with a contribution of 23 per cent each. Agriculture contributed 22 per cent to the provincial total in 1960.

**(j) British Columbia**

In 1960, British Columbia's net value of commodity production increased by 2 per cent to \$1,862,000,000. British Columbia contributed 10 per cent to the Canadian total, ranking third among the provinces.

Manufacturing contributed 46 per cent to the provincial total in 1960. Construction ranked second with a contribution of 23 per cent to the total. The leading primary industry, forestry, accounted for 15 per cent while mining, electric power and agriculture each accounted for 5 per cent.

**4. Scope of the Series**

The scope of the Survey of Production is limited to those industries primarily engaged in the production of commodities. The output of such industries as transportation, communication, trade, finance and service is excluded except insofar as the cost of these services remain in the value added of the "commodity-producing" industries. This is in contrast to the scope of the "Gross Domestic Product" series in the National Accounts which encompasses all industries.

CHART - 6

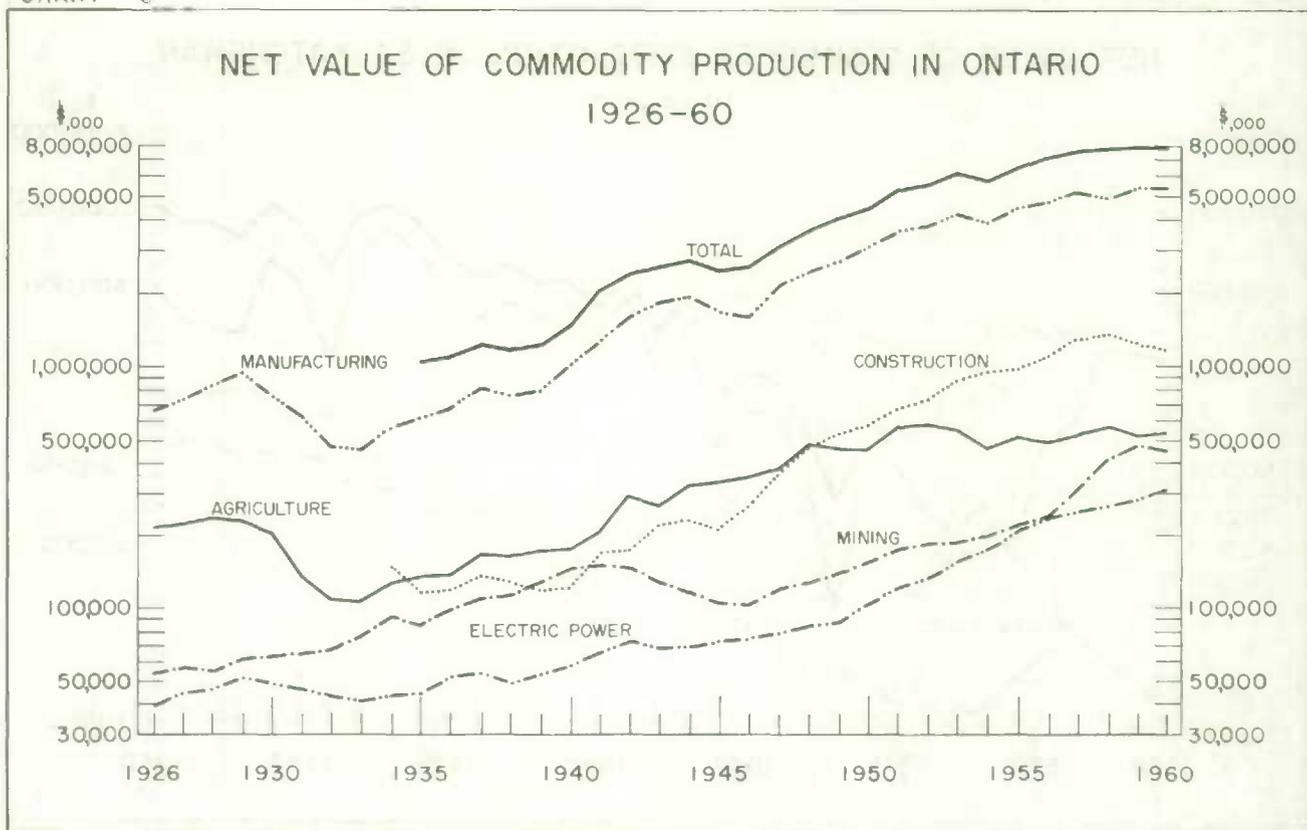

CHART - 7

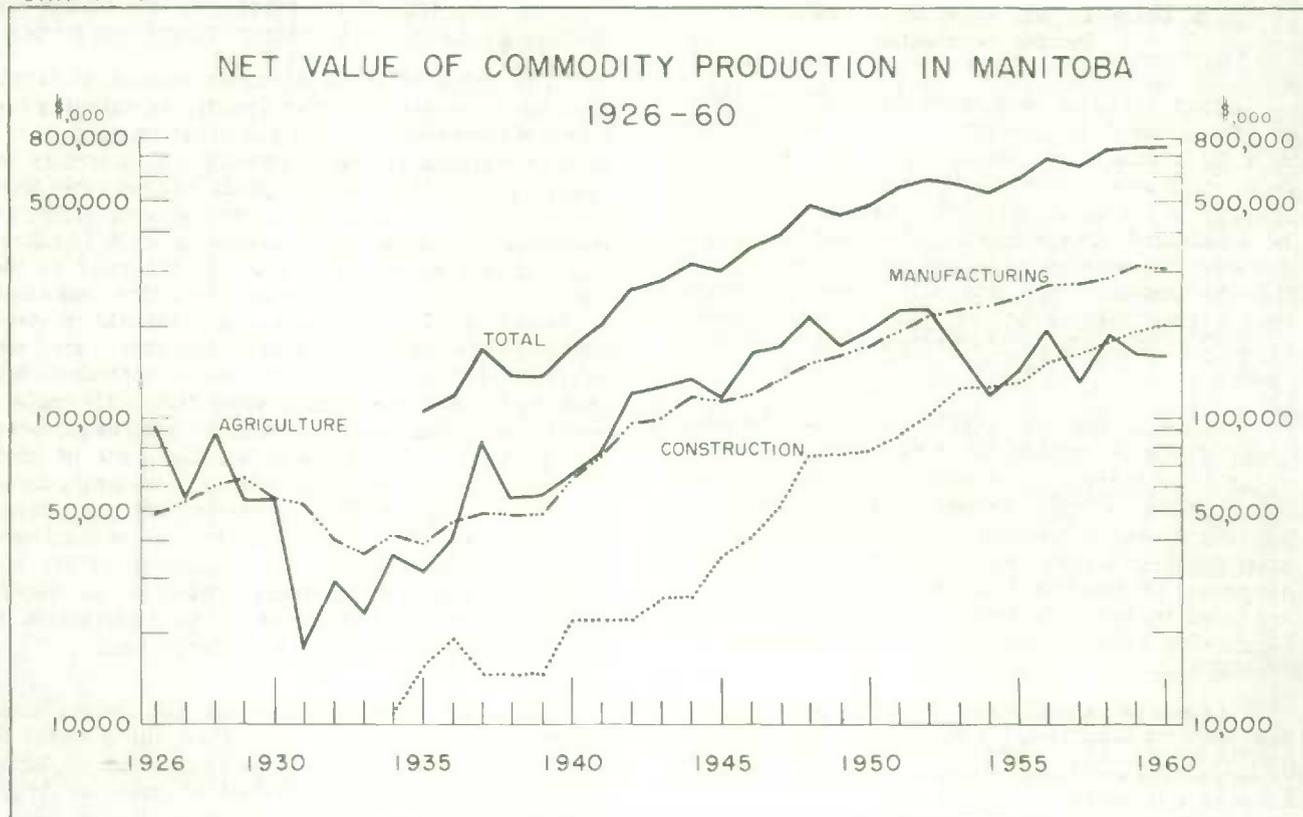

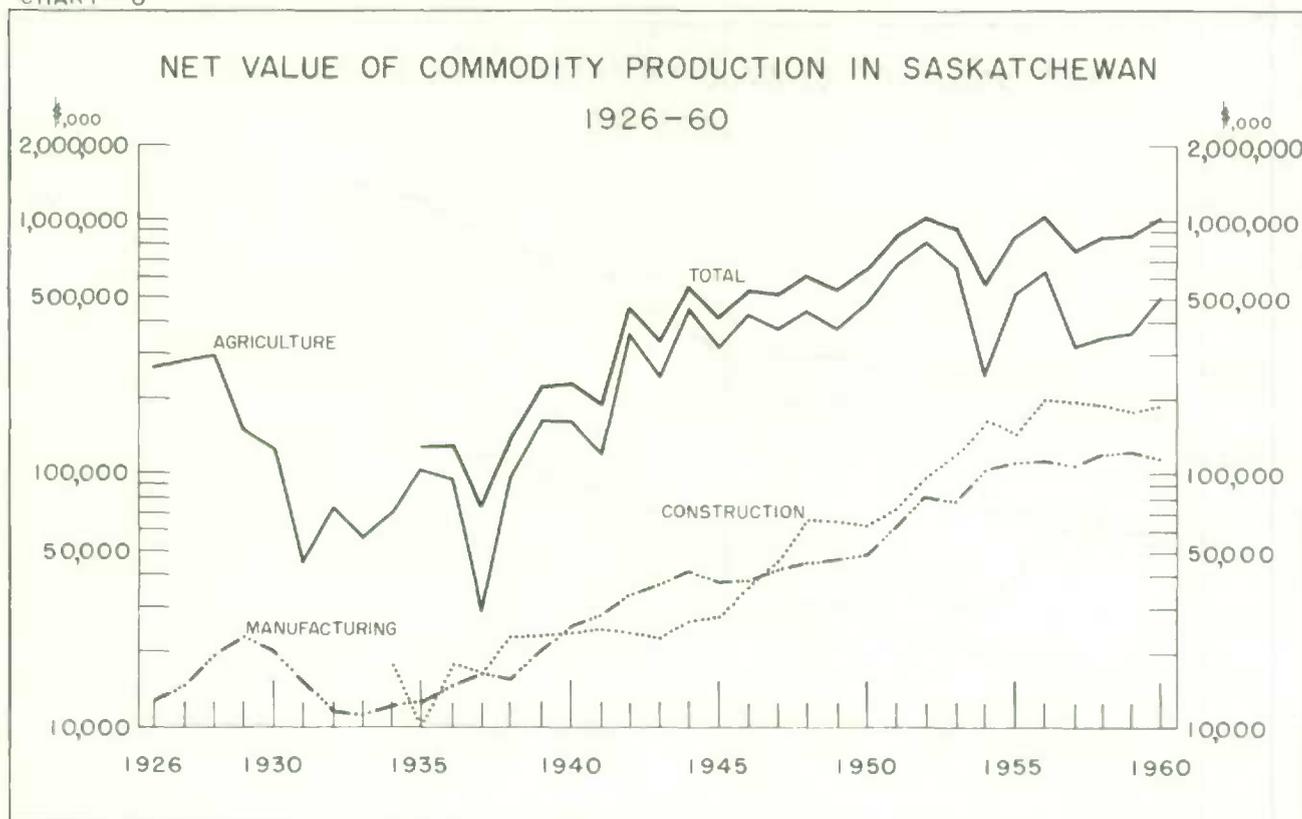

CHART - 8

### 5. Definition and Relation to National Income Accounting

Gross value of production data are not shown in this report.<sup>2</sup> In combining value of production data for a number of industries, it is essential, in order to assess accurately the contribution of each industry to the total, that inter-industry duplication be eliminated. Conceptually, the most meaningful definition of production to use in a report such as this is that of gross domestic product at factor cost. This definition eliminates inter-industry duplication as well as "indirect tax less subsidy" values.

Although not as conceptually desirable as gross domestic product at factor cost, the "net" value of production, or census "value added" definition used in this report's tables, charts and analytical text is generally considered one of the most significant available measures of production for purposes of provincial analysis. Value added is computed by deducting from the total value of output (excluding indirect taxes) for each industry, the

cost of materials, fuel, purchased electricity and process supplies consumed in the production process.

The value of gross domestic product at factor cost can be measured either directly by summing the factor incomes and capital consumption allowances paid or charged by each industry, or indirectly by subtracting all intermediate goods and services from the revenue (ex. indirect taxes) arising from the production of goods and services in each industry. The indirect approach is the one followed in the compilation of the value added statistics contained in this report. These value added residuals for each commodity-producing industry however, are not exactly equivalent to gross domestic product originating in these industries since they still contain certain miscellaneous indirect taxes such as licences and property taxes as well as the cost of such services as insurance, advertising, communications, etc., which originate in the non-commodity-producing industries. For instance, while the cost of insurance incurred by manufacturers is included in the net value of the manufacturing industry as herein presented, it is not included in the contribution of manufacturing to total G.D.P. at factor cost.

<sup>2</sup> Since no data on materials or fuel used are available for some industries, the figures for these industries are, in reality, gross values or gross values partly adjusted, but the amounts of materials and fuel involved are believed to be relatively unimportant.

The data necessary to make the deduction of these business service costs from value added to arrive at a true figure of G.D.P. for each industry and province are not collected at present. Avail-

CHART - 9

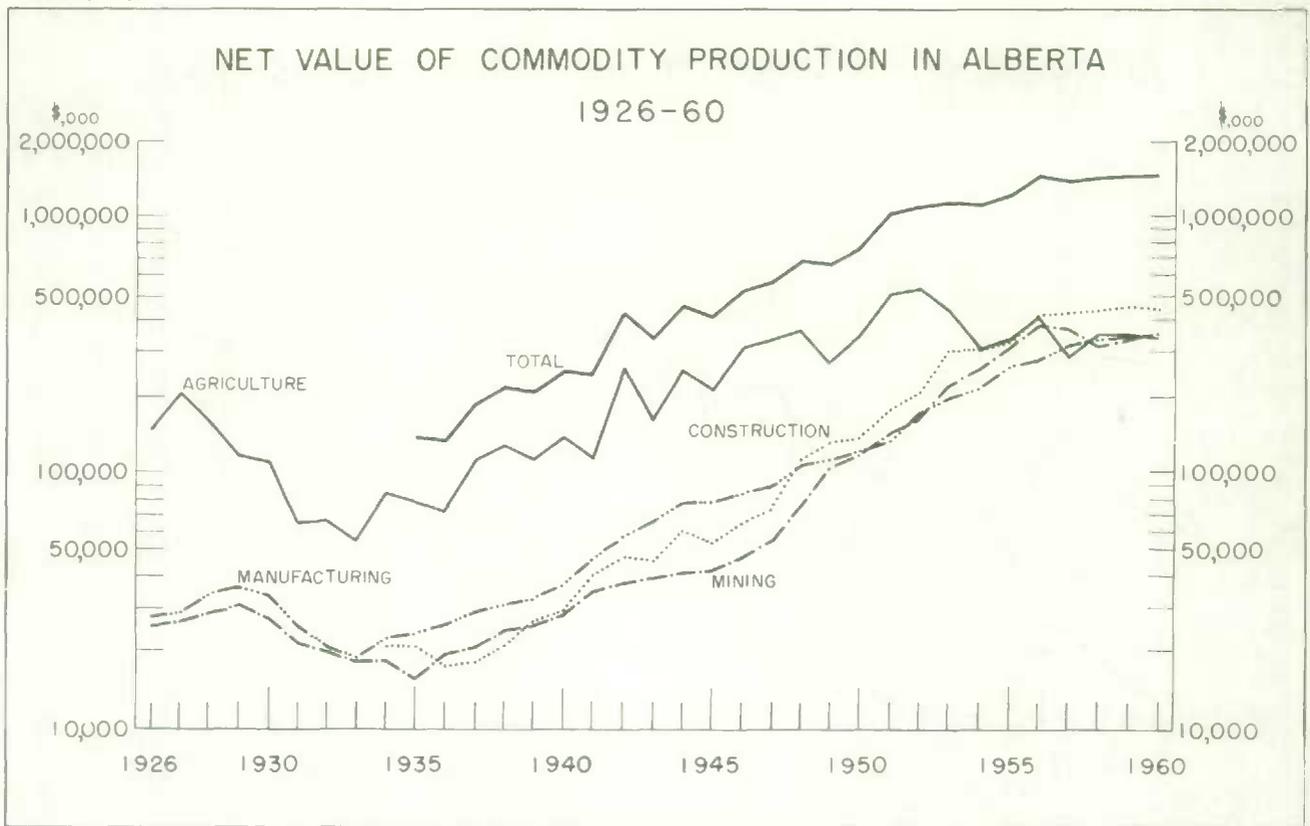

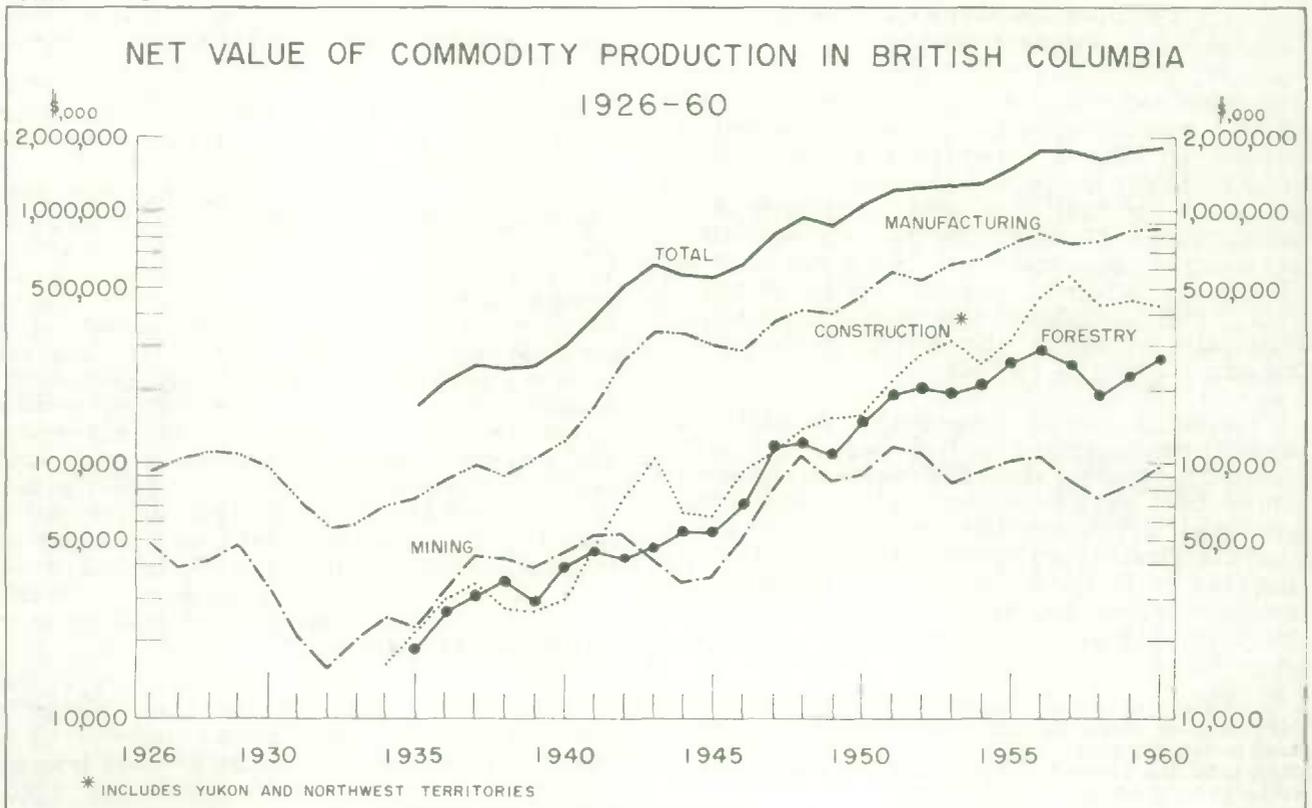

CHART - 10

able data,<sup>3</sup> however, indicate that these costs constitute a smaller share of value added (as herein compiled) for such industries as agriculture and mining than for manufacturing and construction. The contribution to total G.D.P. of the primary industries and of those provinces whose economies are largely dominated by the primary industries is thus proportionately greater than the data contained in this report indicate.

Thus the measurement of the value of output based on net value of production or value added, although mostly "net" within the field covered by this report, contains some duplication if it is used as an approximation of gross domestic product originating. The industry value added figures contained herein are greater than the corresponding G.D.P. figures published in the latest National Accounts reference document and annual bulletins.

One of the major problems of classification is that the data for three factor shares of the published G.D.P. by industry estimates, viz., net income of unincorporated business, investment income, and capital consumption allowances and miscellaneous valuation adjustments are on an "enterprise" basis while data for the other factor shares, viz., wages, salaries and supplementary labour income and the inventory valuation adjustment are on an "establishment" basis. By contrast, most of the value added data for the commodity-producing industries (as published in this report) are on an establishment basis, i.e., each unit of an enterprise is treated as a separate entity and classified to the industry in which it operates. A company may own several establishments which are classified to different industrial divisions. The nature of the available data makes it extremely difficult, in compiling industrial distributions of G.D.P. to get an accurate breakdown of enterprise-type statistics on a plant-by-plant basis for those companies which cross industrial lines; for this reason, the adjustment to an establishment basis is not made to the industrial distribution of G.D.P., as published in the National Accounts, although conceptually it should be made. For instance, the investment income and capital consumption allowances originating in several major mining companies which operate smelting and refining establishments in the manufacturing division are assigned in total to the mining division, while the salaries and wages of these concerns are classified on an establishment basis, i.e., partly to mining and partly to manufacturing.

In the National Accounts, no geographical allocation of data is available for the series which measure production, although a provincial breakdown of personal income and its components is

<sup>3</sup> Industry value added totals were compared, after adjustment for classification differences, with corresponding G.D.P. at factor cost totals for 1949 contained in the D.B.S. supplement to Reference Paper No. 72, *Supplement to the Inter-Industry Flow of Goods and Services, Canada 1949*. The industry values in the latter report are all on an establishment basis.

made. One of the major advantages of the net value of commodity production series is that the statistics can be broken down by province. A major difficulty in the National Accounts is the problem of accurately allocating corporation profits according to the provinces in which they are generated by productive activity. It must be borne in mind, however, that the value of commodity production estimates by province excludes the non-commodity-producing industries and contains statistical and conceptual differences as compared with the National Accounts estimates.

## 6. Sources and Methods

### (a) Agriculture

The series on the net value of agricultural production originates in the Agriculture Division of the Bureau. The computation is effected in connection with the project on "Net Income of Farm Operators from Farming Operations". The *Quarterly Bulletin of Agricultural Statistics* presents the background for the estimates. Gross value of agricultural production is the sum of the cash receipts from the sale of farm products, the income in kind (excluding house rent) and the value of changes in inventories. Income in kind consists of the commodities produced on the farm and consumed by the farm family, valued at their alternative market prices. Operating expenses (excluding taxes on all farm land, net farm rent, depreciation, purchased services, wages to paid labour and interest on mortgages and other debt) are deducted from gross farm production (less house rent) to give the net value of production.

### (b) Forestry

The forestry data are obtained from the Industry and Merchandising Division of the Bureau and contain to some extent estimates based on consumption or apparent production.

The value of materials and supplies used (exclusive of provisions) is estimated for Canada and British Columbia on the basis of returns from the more important logging concerns. For provinces other than British Columbia the total value of materials and supplies is distributed according to the gross value of production, then subtracted from the latter to obtain the net value.

The value of forestry operations includes the value of forest products acquired by farmers from farm wood lots whether retained for own use or sold. To avoid duplication with the agriculture industry which also includes this activity, the value of forestry production originating on farm wood lots is deducted from the value of forestry. The estimates of the value of farm forest products originate in the Forestry Section and are used in computing the net value of agricultural production.

**(c) Fisheries**

The series used for this industry is the total value of fish caught and landed as compiled in the Industry and Merchandising Division of the Bureau. It represents the value of the catch of sea and inland fish before processing. No data are available as to the cost of materials and supplies used by fishermen and the values shown, therefore, are somewhat higher than would be obtained if data were available to compile net value figures.

**(d) Trapping**

The value of production in the trapping industry is obtained from the Agriculture Division of the Bureau. Values of wild life pelts taken are published in the report *Fur Production* and represent the value of the trapping industry. As in fisheries, no data are available for materials and supplies used by trappers, and the value shown is in reality a gross value.

**(e) Mining**

The basic data for the mining industry originate in the Industry and Merchandising Division of the Bureau. The published total of the net value of bullion, ore, concentrates, residues and other minerals shipped from the mines, smelters, brick and cement plants and quarries includes the output of several industries classified to manufacturing in the revised Standard Industrial Classification. These industries are smelting and refining, clay products, cement and lime. (Salt was also included according to the classification used prior to 1960). In order to avoid duplication with the manufacturing industry, the net values of these industries are deducted from the published net values of the mining industry.

**(f) Electric Power**

Electric power statistics originate in the Public Finance and Transportation Division of the Bureau and are classified into two major categories: utilities and industrial establishments. The latter are defined as companies or individuals which generate electricity mainly for use in their own plants. This report includes only the net value of the utilities group of establishments.

The duplication consisting of inter-station purchases of power within the industry and inter-provincial transfers is eliminated. The provincial revenue figures published in the *Electric Power Statistics* reports are not adjusted for inter-provincial

purchases and differ, therefore, from the provincial figures appearing in the tables of this report. The net value of production is obtained by deducting the cost of fuel consumed from the gross value. The cost of other materials and supplies is not available.

**(g) Manufacturing**

The value added by manufacturing industries for Canada and the provinces is published in the reports of the Industry and Merchandising Division. The value added is derived by first adjusting the value of shipments for the change in the value of inventory of finished goods and goods in process and then subtracting the cost of materials and fuel and electricity.

**(h) Construction**

The statistics for construction are based largely on information received from firms and individuals paying for the work done. The data represent all new and repair construction undertaken in Canada and thus include work done by the labour force of industrial concerns, institutions, governments and individuals, in addition to that done by general, trade and sub-contractors.<sup>4</sup> The figures on the value of construction include all costs incurred, directly or indirectly, by the firm paying for the work and follow the same concepts and definitions used in the construction estimates which appear in the reports *Private and Public Investment Outlook*. Of the total value of construction shown, 75 per cent is the result of direct surveys of business firms, institutions, government-owned enterprises and departments and of residential building activity. The remainder is estimated. Further details on definitions, sources and methods are given in the D.B.S. Bulletin, *Construction in Canada*. The estimates of the cost of materials used are based on an annual survey of construction contractors. These surveys provide ratios of the cost of materials used to value of work performed. These are then applied to the total value of work performed as reported in the investment survey to yield the total cost of materials used. The net figures published in this report are then obtained by subtracting the cost of materials used from the total value of construction work performed.

<sup>4</sup> If it is assumed that the value of work done on repairs and maintenance by "own account" workers of individual industries is also reflected in the value of the products of those industries, there is a relatively small amount of duplication between the net value of the construction industry and the net values of the other commodity-producing industries.

TABLE 1. Net Value of Production in Canada by Industry, 1957-1960

Industry	1957	1958	1959	1960 <sup>1</sup>
	\$'000
