DEPARTMENT OF TRADE AND COMMERCE

Private and Public Investment in Canada Outlook 1961

and

REGIONAL ESTIMATES

Published by Authority of The Honourable George Hees Minister of Trade and Commerce

ROGER DUHAMEL, F.R.S.C. QUEEN'S PRINTER AND CONTROLLER OF STATIONERY **OTTAWA**, 1961

INTRODUCTION

This report sets out the 1961 capital spending intentions of all sectors of the Canadian economy. Comparative figures of actual expenditures in 1959 and 1960 are also given. The figures, for the most part, are based on the results of a questionnaire survey of individual companies and other spending agencies. These questionnaires were completed near the end of 1960 and the figures reflect spending plans as formulated at that time.

The estimates cover total outlays for construction and for the acquisition of producers' machinery and equipment by Canadian business, institutions and governments, together with expenditures for housing. For most industry groups the expenditure estimates are based upon the sum of the reported spending plans of individual companies within each industry. In total about 18,000 business establishments were surveyed as to their investment intentions. The totals shown have been adjusted to include imputed expenditures for firms that did not report and for the smaller firms which were not surveyed. In a few areas, where the survey approach is not considered to be practical, expenditures were estimated independently on the basis of current trends and expert opinion in these fields. The principal areas so estimated are agricultural investment and housing expenditures. Estimates of outlays by governments and institutions were based on a survey of the appropriate agencies.

For the purposes of this report construction includes both contract and force account work. In addition to building construction the estimates cover all types of engineering construction such as roads, dams, transmission lines and pipe lines as well as oil well drilling and mine development. The machinery and equipment category covers the purchase of all such items which are used either in producing goods or providing services but does not include durable goods purchased for personal use. Included, as well as industrial machinery, are transportation equipment, agricultural implements, professional and scientific equipment, office and store furnishings and other similar capital goods. Excluded, for the purpose of this report, are outlays for equipment for the Department of National Defence.

Information on capital spending intentions provides a useful lead to market conditions both in the economy at large and in particular industries. Since such expenditures account for a large, and traditionally variable, proportion of the national product, the size and content of the investment programme provides an indication of certain of the more volatile demands to be placed upon the productive capacities of the economy during the period covered by the survey. In addition, information on the relative size of the capital expenditure programme planned, both in total and for individual industries, gives an indication of the views of management on prospective market demands in relation to present productive capacity.

Repair expenditures on structures and machinery and equipment are also given in the report but these are shown separately. By including these expenditures a more complete picture is provided of all demands likely to be made on labour and materials in accomplishing the programme.

This report on the outlook for investment in Canada in 1961 is a joint project of the Dominion Bureau of Statistics and the Economics Branch of the Department of Trade and Commerce.

JAMES A. ROBERTS,

Deputy Minister, Department of Trade and Commerce.

SECTION I. APPRAISAL OF THE 1961 CAPITAL PROGRAMME

The Total Programme

Present plans for capital spending by all sectors of the Canadian economy involve total outlays of \$8.3 billion in 1961. These plans were revealed in a recent survey covering business establishments, institutions and all levels of government. Included in the total are estimates of expenditures for housing. The accomplishment of such a programme would mean that total capital outlays in the present year would exceed those of 1960 by more than \$100 million. The increase now planned in total capital spending is wholly accounted for by a larger construction programme. Outlays for new construction are expected to be about 4 per cent greater than those of last year. Plans for the purchases of machinery and equipment, on the other hand, involve a decline of about 2 per cent from the levels of 1960. A capital programme of the magnitude now planned would involve about 23 per cent of Canada's gross national product being devoted to expanding, modernizing and renewing the nation's productive facilities. This is about the same proportion of gross national product that has been devoted for this purpose in the postwar period as a whole.

The following table illustrates the trend in capital spending in recent years in both current and constant (1949) dollars.

		(Capital E	xpenditures	3			pital ditures

¹ Newfoundland not included in these years.

The Programme in Relation to Recent Trends

Since 1958, capital spending in Canada has remained at a high and fairly stable level. The capital programme planned for 1961 suggests a continuation of this trend. Cupital outlays reached a peak of more than \$8.7 billion in 1957, declined to less than \$8.4 billion in 1958 and have varied within a fairly narrow range since. While total investment has shown no distinct trend in recent years this has not been true of some of the major sectors of investment. Business capital outlays declined sharply, by about 14 per cent, between 1957 and 1958. In each of the past two years such outlays have shown a little further decline with the reduction amounting to about 1 per cent in each year. These moderate declines in business capital spending have been more than offset by an increasing rate of expenditure for social capital with outlays for hospital and educational facilities and governmental improvements constituting a continually larger proportion of total investment. Expenditures for business and social capital combined have shown moderate increases each year since 1958. The major variable in the investment programmes of the past few years has been the rate of housebuilding activity. Expenditures for housing rose sharply in 1958 to reach a record level, partly offsetting the substantial decline that occurred in business investment. This high rate of housebuilding activity continued in 1959 but was followed by a sharp decline in 1960. The \$200 million decline in capital expenditures in the past year was wholly attributable to this reduced rate of housing activity.

Capital expenditure plans indicate that the trends apparent in both business and social capital spending in recent years will continue in 1961. Business investment is expected to ease a little further in the present year with the decline being more than offset by larger outlays for social capital. Housing expenditures, though likely to remain below the record levels of 1958 and 1959, are expected to show some modest improvement over those of last year.

The Composition of the Programme

The moderately lower business investment programme anticipated for 1961 is largely the result of a sharp reduction of capital spending plans in the transportation industry. Capital outlays by the railways, as now planned, involve a decline of close to \$100 million from the levels of last year. This reflects the completion of major railway lines serving new mining areas and somewhat lesser requirements for new railway rolling stock. Also the large-scale re-equipment programme now being carried out by the commercial airlines will involve less outlay in 1961. The declines in the transportation sector are expected to be partially offset by a larger capital programme in the fuel and power industries. In this area expenditures for new pipe lines and associated facilities related to the export of natural gas provide an important stimulus to investment. In addition, the power companies plan a moderately larger capital programme in 1961. In other major sectors of business, plans call for a continuation of capital spending at close to the levels of last year. This is true of the forest and mineral products industries, other commodity producing industries and commercial enterprises. Within the totals significant changes occur in some industries but these tend to be offsetting. For example, sharply lower capital programmes in the iron and steel industry are offset by expanded plans in the chemical industry, and a reduction in capital spending by wholesale and retail trade establishments is matched by plans for increased outlays for office buildings and shopping centres.

In the area of social capital, outlays both by institutions and governments are expected to be higher in 1961. The strength in institutional investment is largely attributable to a much expanded hospital programme, with expenditures for new hospital facilities, as now planned, being almost double those of last year. An increased rate of expansion by universities also contributes to the strength in this sector. Government capital spending at the federal and municipal levels is expected to exceed that of 1960 while outlays by provincial governments are planned to continue at last year's rate.

On the whole, while there are diverse movements expected within various industry groups, in total, it is anticipated that spending for social capital will continue to account for an increasing proportion of the total capital programme. Increases here will more than offset the slightly lower level of business investment expected.

¹ Preliminary. ² Intentions.

The Programme by Type

Present plans indicate that the 1961 investment programme will place a somewhat greater emphasis on construction and less on machinery purchases than was the case last year. Construction outlays, according to these plans, will increase by about 4 per cent while machinery purchases are expected to be about 2 per cent lower than those of 1960.

Total Capital Expenditures	8, 417	8,200	8, 336	100.0	100.0	100.0		

¹ More detail on the construction programme by type, together with other related data, will be presented in the Dominion Bureau of Statistics report "Construction in Canada-1959-1961" to be published later.

The increased strength expected in construction will be concentrated in building construction. It is anticipated that the demand for institutional buildings, particularly hospitals, will be sharply higher. This, along with a continuation of commercial building at 1960 rates will more than offset the moderate decline expected in industrial building. Expenditures for construction of an engineering type, in total, are likely to be little changed from those of last year. Within the total, demands for new pipe lines, municipal works such as sewers, water works and roads and for power facilities will likely increase in 1961. However, the expected sharp drop in railway construction and some reduction in demand for telephone facilities will offset the increases in other types of engineering construction.

Housebuilding activity is expected to show some moderate improvement over that of 1960. During 1960 about 109,000 new housing units were started and about 124,000 units were completed. Towards the year end the rate of housing starts had improved substantially. The estimates here provide for this rate to be about maintained in 1961, bringing starts for the present year above those recorded for 1960 as a whole. The number of units completed in 1961 will be affected by the carryover of uncompleted houses from the previous year. At the start of the year there were about 16,000 fewer houses under construction than at the beginning of 1960. With the increase in starts assumed for the purposes of this report, this would mean that completions would be little different from those of last year. These assumptions of a higher level of starts and little change in completions involve a moderate increase in expenditures for housing in 1961.

The lower level of machinery purchases planned for 1961 is likely to be reflected in a reduced demand for industrial machinery and transportation equipment. The weaker demand for industrial machinery relates mainly to the reduced level of expansion in the iron and steel industry. In the transportation equipment category requirements of both commercial aircraft and railway rolling stock are likely to be lower in 1961. Demand for most other types of machinery such as agricultural implements, mining machinery and office and store equipment is likely to continue at about last year's rate.

Repair Expenditures

In addition to the \$8.3 billion planned for capital purposes, outlays of \$2.95 billion are expected to be made for the repair of existing facilities.

Expenditures for the repair of structures are likely to total over \$1.4 billion, bringing total outlays for construction, both new and repairs, to \$7.1 billion or 4 per cent above similar expenditures made last year. Similarly, outlays for the repair of existing machinery and the purchase of new machinery, in total, are expected to amount to \$4.2 billion or about 2 per cent less than in 1960.

The Programme by Regions

Present plans call for capital spending to be maintained or moderately increased in all major regions of the country. The programme in individual provinces will be affected by the stage of completion of a few very large projects. In some provinces major projects have either been completed or are nearing completion, in others such projects are reaching a period of peak activity.

Capital outlays in the Atlantic provinces, as a whole, are expected to continue at about the same level as in 1960. In New Brunswick some major projects were completed in 1960 and capital spending is likely to be lower in 1961. On the other hand, higher levels of expenditures are indicated for Nova Scotia and Newfoundland. In central Canada outlays for mining developments in Quebec are planned at a substantially lower level in 1961 and this will tend to offset increasing investment in other industries in the province. A moderate increase in capital spending in Ontario will bring expenditures for the central provinces, as a whole, above those of last year. The largest increases planned for 1961 are in the western provinces. This increase is mainly attributable to outlays to be made for natural gas facilities in Alberta and British Columbia. The near completion of major mining developments in Manitoba will mean a lower level of investment in that province.

The estimates given for the smaller provinces, in particular, are very tentative. Changes in plans by a few companies or the initiation of new projects may significantly change the estimates given here.

The Significance of the Programme

The statement of capital expenditure intentions as outlined in this report provides information on the planned outlays by all sectors of the economy for new structures and for the acquisition of machinery. The relative size of the programme planned gives an indication of the demands likely to be placed on various sectors of the economy in accomplishing the programme. The intentions, too, provide some measure of the extent to which businessmen and other agencies expect to expand and renew their productive facilities.

The proposed construction programmes can be expected to place moderately greater demands on the construction industry and on the suppliers of most types of building materials. This should result in the generation of some additional employment in the related industries. While the prospects are that machinery purchases, in total, will be slightly below those of 1960, most of the types of machinery for which a reduced demand is anticipated have tended to be purchased from outside Canada. The overall demand for machinery of a type made in Canada will probably be maintained.

The foregoing appraisal of the 1961 capital programme relates to the stated investment intentions as outlined in this report. These intentions represent the plans of business, institutions and governments as reported at the end of 1960. In the event that economic conditions change as the year progresses, investment plans, too, may be changed. Unforeseen factors, too, such as prolonged work stoppages, may affect the extent to which present plans may be accomplished.

TABLE 8. Business and Other, Canada, 1959 to 19611 (Millions of Dollars)

¹ Actual expenditures 1959, preliminary 1960, intentions 1961. ² Includes expenditures in agriculture, fishing, forestry, mining, manufacturing, the construction industry, rental housing, trade, finance and commercial services. ³ Includes expenditures in owner-occupied housing, institutional services and government departments.

SECTION III. DEFINITIONS, COVERAGE AND COMPARATIVE SUMMARY

Definitions

The purpose of this report is to set out the anticipated gross expenditures on durable physical assets, both new and repair, of the whole Canadian economy. These comprise in general the facilities and tools used to produce goods and services.

Housing is not generally considered a capital expenditure in the sense mentioned above, but it has been included in this report because it forms a large proportion of construction expenditures and has cyclical fluctuations similar to those which characterize business, institutional and government capital expenditures.

The main emphasis of the report is on capital rather than repair expenditures. New capital expenditures include the cost of procuring, constructing and installing new durable plant and machinery, whether for replacement of worn or obsolete assets, or as net additions to existing assets. Included are all costs charged to capital account, such as architectural, legal and engineering fees, as well as the value of work on capital assets undertaken by the firm with its own labour force. Gross outlays are reported, without any deduction for scrap or trade-in value of old assets. Excluded are expenditures made for the acquisition of previously existing structures, for used machinery and equipment and for land, since outlays of this type involve only the transfer of property and not the creation of a capital asset.

The intention is to include the cost of all new plant and equipment which normally has a life of more than one year. For this reason, companies were asked to report, as capital expenditures, all purchases charged to fixed assets account. This method of reporting omits certain types of equipment which are bought regularly out of ordinary revenue and charged to current account. Adjustments have been made where necessary to take account of such omitted capital items and separate figures are shown in the relevant tables under "capital items charged to operating expenses".

Repair expenditures represent outlays made to maintain the operating efficiency of the existing stock of durable physical assets. Major repair costs which materially lengthen the expected serviceable life of the assets or raise its productivity are treated as part of capital expenditures. Excluded also are costs for the routine care of assets such as cleaning and oiling of machinery.

Reconciliation between Private and Public Investment and "Gross Fixed Business Capital Formation" as per National Accounts.

New capital investment as shown in this report covers all capital outlays by both private groups and government authorities on durable physical assets. This coverage is therefore somewhat greater than the "new construction and new machinery and equipment" figures included as a component of Business Gross Fixed Capital Formation, published in the National Accounts. Generally speaking, the National Accounts series includes only expenditures of organizations whose principal source of revenue is from the sale of goods or services to the public together with new privately initiated residential construction and government rental housing. This excludes the items listed in the footnote to Table 9, the largest of which is direct government department outlays. All these items are included under government expenditures for goods and services in the National Accounts.

A reconciliation between private and public new investment and "new construction and new machinery and equipment" as used in the National Accounts is shown in Table 9, for the years 1959, 1960 and 1961.

TABLE 9. Reconciliation with National Accounts Investment (Millions of Dollars)

¹ In addition to government built, non-rental housing, this category consists of expenditures for provincial hospitals, provincial and municipal schools and those outlays made directly by government departments.

Coverage

Estimates for most of the sectors covered in this report are based on questionnaire surveys. Government expenditure figures are based on a direct survey of municipal, provincial and federal departments or agencies. The per cent coverage in each of these surveys is given in the following table headed "Coverage of 1960-61 Surveys". Those groups for which independent estimates were made are listed in the table with a blank in the per cent column.

The total coverage of the survey may be expressed in several ways. Actually reported expenditures account for 84.9 per cent of total outlays in those groups covered by direct survey and for 75.0 per cent of total estimated expenditures in all sectors. The estimates of total outlays in the groups covered by survey, amounting to 90 per cent of all spending, are thought to be of a better quality than the remaining 10 per cent which represent independent estimates based on much less complete information.

The figures in the various tables of this report are estimates of total expenditures. In order to approximate full coverage for Canada, adjustments were made to allow for those firms which did not report. In manufacturing, the method used to inflate the reported expenditures was to multiply the known expenditures by a factor obtained by dividing the total value of shipments in 1958 of all the firms in each industry by the corresponding 1958 total for the firms reporting in the 1961 survey. In carrying out this procedure it has been assumed that the proportion of shipments of the reporting establishments in both 1958 and 1961 has not changed significantly during the period and further that there is a close relationship between total value of shipments and capital investment. In the utilities, trade, finance and institutional and commercial services sectors the same principle has been followed using appropriate basic data for the sector concerned. Expenditures reported by establishments for which no production or other basic data are available are included as "net additions". Since reporting firms accounted for 75.0 per cent of the total, it is believed that the estimating procedure for the nonreporting firms and the sectors not covered by direct survey, amounting to 25.0 per cent, does not introduce any great margin of error into the total. Estimates for individual industries or regions are, of course, subject to greater error than the total figures for Canada.

¹ Coverage is calculated by expressing expenditures of reporting firms as a percentage of total estimated expendi-

Coverage is calculated by expressing expenditures of reporting firms as a percentage of total estimated expenditures.
 ³ Independent estimates were made of expenditures in this group.
 ³ In manufacturing and primary industries only establishments having a gross value of shipments of over \$200,000 were canvassed in entitety. Thus, coverage is apt to be lower for groups where there are a large number of small companies such as forestry and wood products.
 ⁴ Coverage for residential housing is calculated by expressing public and privately initiated housing covered by survey as a percentage of total estimated completions.

Both the 1960 preliminary actual expenditures and the 1961 forecast expenditures were reported by business establishments on the same questionnaire form. With the reported figures covering both years coming from the same group of establishments and with the estimating techniques for non-reporting firms the same for each year, the percentage change from 1960 to 1961 can be calculated with more precision than the absolute magnitude of expenditures in the two years.

Comparison of 1960 Realizations with Intentions.

In considering the accuracy of investment intentions, two separate factors should be kept in mind. First, it is necessary to consider the extent to which investment plans are formulated in advance. Second, consideration ought to be given to the comparison of anticipated investment expenditures with the actual investment statistics once they are available for the period in question.

So far as the first point is concerned, it should be noted that it is not always easy to obtain reliable data on the future plans of business firms. Some firms do not decide upon their complete investment programme at the beginning of the year and are unable to state their intentions precisely. Generally however, new investment expenditures, particularly those on structures and large installations, need previous planning and preparation and most firms are able to give a good estimate of expected outlays. In addition, the seasonal character of construction in Canada frequently means that early decisions must be made regarding capital spending plans for the year ahead.

In considering how closely statements of intentions compare with actual realization, it should be kept in mind that the figures given for 1961 represent the capital expenditure intentions of businessmen and others at the time the surveys are made. These intentions may change for a variety of reasons as the year progresses. Changes in the general business outlook may make it desirable to either modify or expand investment spending, changing price trends may result in revision of cost estimates, and shortages of materials or labour and unfavourable weather may retard progress on projects. In addition, individual businesses have different planning periods and in some cases plans are kept flexible as a matter of policy.

The table on the following page provides a comparison of the 1960 capital expenditure intentions as of January 1960, the revised capital expenditure intentions as of June 1960, and preliminary estimate of realizations as of now. The present estimate of capital outlays for 1960 is 6.5% below the original intentions and 5.9% below the revised intentions. Construction expenditures decreased 7.7% from the original estimate and 5.8% from the revised; machinery and equipment decreased by 4.1% and 6.1%.

In considering this comparison it should be kept in mind that the 1960 preliminary actual figures are still subject to further revision as more accurate information becomes available. Although these revisions do not as a rule affect the overall totals greatly, there are sometimes important changes within some of the groups.

The 1959 preliminary actual figures published last year have been revised and changes have been incorporated in the 1959 actual figures.

TABLE 11. Comparison of Intended With Realized Expenditure in 1960 (Millions of Dollars)

¹ As of January, 1960.

¹ Revision is based on results of mid-1960 partial survey of those firms reporting expenditures at commencement of year.
 ³ Preliminary figure.

⁴ Firms reporting in the mid-year survey were not asked to re-examine repair expenditures, as past experience revealed relatively small changes in this type of expenditure. Mid-year estimates are therefore a repeat of figures reported at the beginning of the year.

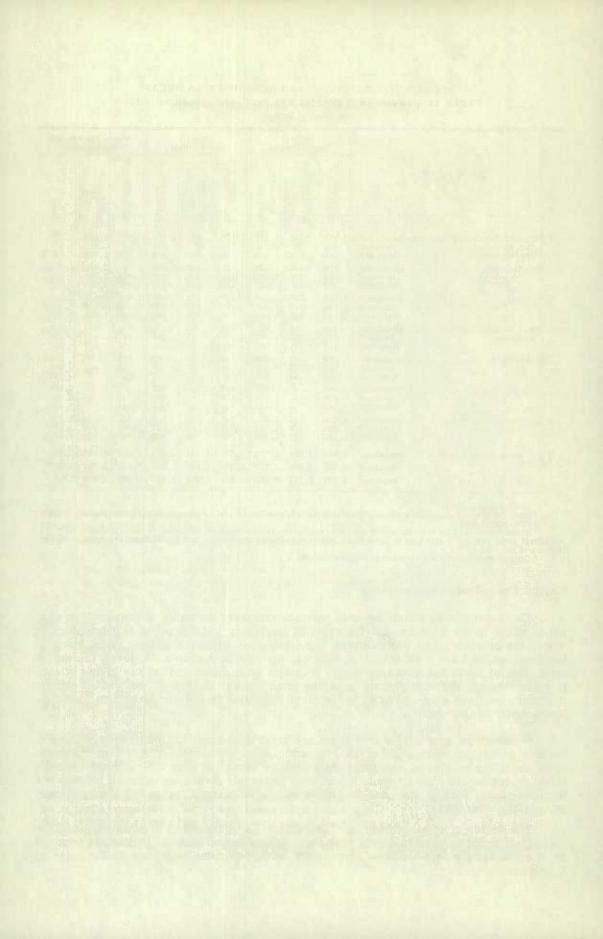

⁵ Construction industry not surveyed at mid-year review.

Capital Expenditures by Provinces

The expenditures shown for each province represent the value of construction work put in place in the province and the value of machinery and equipment acquired for use within the province. Such expenditures represent gross additions to the capital stock of the province, and are a reflection of economic activity in that area. However, the actual production of these assets may generate its major employment and income giving effects in other regions. For example, the spending of millions of dollars on western oil refineries and pipe lines means activity in the steel industries in Ontario as well as construction activity in the Prairies.

It should be appreciated that there are great statistical difficulties in making a precise geographic allocation of past or anticipated investment since many business firms operating in several provinces do not either record or plan their capital expenditures geographically. As a result, it has been necessary to use approximate breakdowns in many cases. Such is the case for investment in railway rolling stock, ships, aircraft and certain other items.

The degree of detail provided in Tables 13 to 26 is dependent to some extent on the validity of methods used to obtain provincial estimates and also on limitations imposed by the "Statistics Act". These restrictions have particular relevance in the case of smaller provinces.
