NOTICE

This issue contains a new series of wholesale prices statistics, Industry Selling Price Indexes (1956=100). These indexes were introduced in Reference Paper Catalogue No. 62-515 (Occasional) which contains monthly figures covering the period 1956 to 1959. Monthly figures for 1960 are contained in the Appendix, page 50, of this issue, while current figures appear in Tables 5 and 6. It is recommended that users consult the above-mentioned publication for a description of the concepts, methods and nature of data relating to the new series. Copies of the reference paper may be obtained through Information Services Division, D.B.S. (price \$1.50).

The attention of users is drawn to the revised format and content of the tables of this publication. These changes were adopted to assist users in locating and interpreting current data.

NOTES ON PRICES AND PRICE INDEX NUMBERS

General Wholesale Index (1935-39=100)

The General Wholesale Index rose to 231.3 in January, up 0.5 per cent from the December 1960 index of 230.1, and 0.3 per cent higher than the January 1960 index of 230.5. Seven of the eight major group indexes were higher in January while the remaining one, the Chemical Products Group index of 188.0 was unchanged from a month earlier.

The Animal Products Group index advanced 1.0 per cent to 258.5 from the December index of 255.8. The increase, which was the third in as many months, was mainly caused by higher prices for fresh and cured meats, livestock, fishery products, milk and its products, and hides and skins. In contrast to the overall group increase, prices for eggs were sharply lower. The Non-ferrous Metals Group index rose 0.7 per cent from 174.9 to 176.2 as price increases for nickel and tin outweighed lower prices for lead and its products, and prime western zinc. Higher prices for grains, livestock and poultry feeds, sugar and its products, and vegetable oils and products were the chief contributors to an increase of 0.6 per cent from 198.7 to 200.0 in the Vegetable Products Group index. The Wood Products Group index also rose 0.6 per cent from 300.2 to 302.1, mainly as a result of higher returns for export sales of newsprint and woodpulp, though increases of lesser importance were also recorded for fir and hardwoods. Minor advances occurred in the following three major group indexes: Textile Products from 229.6 to 230.3, Non-metallic Minerals from 185.1 to 185.5, and Iron Products from 254.6 to 254.7.

The following table shows some of the more noteworthy changes:

Industry Selling Price Indexes (1956=100)

Of the 98 manufacturing industries for which Industry Selling Price Indexes are calculated 34 had higher indexes in January 1961 than in December 1960 and 27 indexes were lower than a month earlier. For the remaining 37 industries the indexes were unchanged.

In January the average level of the 98 indexes (1956=100) was 102.7 and the median was 103.4; that is, half of the indexes were above and the other half were below 103.4. This compares with an average of 102.7 and a median of 103.8 for December 1960.

The following table summarizes December-January price movements by major industry group:

Canadian Farm Products Price Index (1935-39=100)

The index of Canadian Farm Products at terminal markets moved up 0.7 per cent, from 219.6 to 221.1, between December and January. The Animal Products index, up 0.7 per cent from 276.5 to 278.5, reflected increases for hogs and lambs both East and West; steers and poultry in the East; and calves in the West. Eggs moved sharply lower on both markets. Western raw wool was also down. The Field

Products index advanced 0.6 per cent from 162.7 to 163.7 as higher prices were reported for rye, flax and potatoes in the West and for Eastern grains. Prices were lower for peas in the East. Indexes for the crop year August 1959 to July 1960 have been revised to include an interim payment for Western wheat, and final payment for Western oats announced February 14, 1961. For details see table 2 and notes page 45. The indexes are subject to further revision pending announcement of the final payments for Western wheat and barley.

Security Price Indexes

The Investors Index of 93 common stocks on the base 1935-1939=100 advanced 6.3 per cent from 260.2 to 276.6 between December and January. All major group indexes were stronger, as follows: 72 Industrials up 6.7 per cent from 268.0 to 286.0; 7 Banks up 6.1 per cent from 338.1 to 358.7; and 14 Utilities up 4.0 per cent from 193.0 to 200.7. Increases were registered by all sub-groups. For the nine Industrial sub-groups gains were led by Oils up 9.4 per cent, and Building Materials up 8.7 per cent. The three Utility sub-group increases were headed by Power and Traction, up 5.8 per cent.

The index of 27 Mining Stocks (1935-1939=100) advanced 6.5 per cent in the same period, from 108.5 to 115.5, reflecting gains of 7.4 and 5.5 per cent respectively for 21 Golds and 6 Base Metals.

The index of 27 Preferred issues (1935-1939=100) rose 0.7 per cent from 156.8 to 157.9.

The four supplementary indexes of common stock prices, on the base 1956=100, also showed gains as follows: 9 Primary Oils and Gas up 13.7 per cent from 40.8 to 46.4; 7 Uraniums up 9.0 per cent from 59.8 to 65.2; 5 Pipelines up 6.1 per cent from 109.7 to 116.4; and 5 Investment and Loan, up 5.2 per cent from 129.9 to 136.7.

The Consumer Price Index (1949=100)

The Consumer Price Index declined 0.3 per cent from 129.6 to 129.2 between December 1960 and January 1961. A year ago the index was 127.5.

The current decrease was largely the result of a 0.7 per cent drop in the Food index, combined with declines in the Clothing index and the Household Operation index of 0.9 and 0.2 per cent respectively. The other Commodities and Services index was unchanged and the Shelter index rose a fractional 0.1 per cent.

The Food index moved from 125.3 to 124.4 as egg and fresh tomato prices were substantially lower and price declines were also reported for citrus fruits, bananas and canned tomatoes. Prices were higher for most other fresh fruits and vegetables, and meats.

The slight rise in the Shelter index, from 144.6 to 144.7, reflected similar movements in both the rent and home-ownership components.

The drop in the Clothing index, from 112.6 to 111.6, reflected widespread January sales affecting in particular, men's overcoats, women's fur and cloth coats, boys' parkas, and girls' winter coats and cotton dresses.

The Household Operation index declined from 123.5 to 123.3 as household appliance prices continued to move downward. Sale prices were still a factor in prices of furniture and textiles, but prices of floor coverings and household supplies and services were at higher levels.

The Other Commodities and Services index was unchanged at 138.3 as slightly lower prices for new passenger cars balanced minor increases for some personal care and recreation items.

Wholesale Price Indexes

Canadian Farm Products

Wheat prices used in this index are buying prices of the Canadian Wheat Board, for Nos. 1, 2 and 3, Manitoba Northern at Fort William-Port Arthur. The initial payment price is first used and revised as further payments are announced.

Final wheat participation payments for the crop year August 1958-July 1959 were announced June 15, 1960. The price of No. 1 Manitoba Northern was adjusted to \$1.594 per bushel, No. 2 to \$1.559 and No. 3 to \$1.483, and the indexes revised accordingly. For the crop year 1959-1960, the initial payment of \$1.40 for No. 1 Manitoba Northern was increased to \$1.50 as of February 14, 1961. Subsequent indexes are based on an initial payment of \$1.40.

Commencing August 1, 1949, Western oats and barley were brought under control of the Canadian Wheat Board. Prices used for Canadian Farm Products since that time have been initial payments to farmers, with participation payments included whenever they are announced. For the crop year 1958-1959 final payments were announced April 1, 1960 which brought the price to \$.90 per bushel for No. 1 Feed barley and \$.694 for No. 2 C.W. oats. Initial payment for the crop years 1959-1960 and 1960-1961 was \$.87 for No. 1 Feed barley. For oats final payment for the 1959-1960 crop year was announced February 14, 1961, which brought the price for No. 2 C.W. oats to \$.771 per bushel; for the 1960-1961 crop year the initial payment was \$.60 for No. 2 C.W. oats.

For final revised indexes August 1945 to July 1952 see Prices and Price Indexes, May 1953, Table 21. For subsequent years see Table 4 of February 1954, May 1955 and 1956, and Table 2 of May 1957, May 1958, and July 1959. Indexes subsequent to July 1959 are subject to revision.

The Non-Residential Building Materials Price Index (1949=100)

A second special purpose price index related to the construction industry entitled "Non-Residential Building Materials Price Index" is shown in Table 8. This index has been constructed specifically to measure the price change of materials used in non-residential building construction. It supplements a price index applicable to materials used in residential construction which has been available for some years. The new index has been constructed on the base 1949=100, using weights obtained from data on cost of building materials provided by general and trade contractors for a sample of buildings constructed in Canada during the years 1948-1950.

The methods of constructing the index are explained in some detail in D.B.S. Reference Paper No. 43, entitled "Non-Residential Building Materials Price Index, 1935-1952", which was released on August 21, 1953 and which is available for the sum of 25 cents on request to the Dominion Statistician. This publication also comments on the uses and limitations of the index, and provides the total index by years from 1935 to 1952, and by months for the period January 1949-July 1953. Price indexes for twelve principal component material groups have been calculated by months from January 1949 to July 1953 and these indexes are also contained in the above mentioned publication.

The Residential Building Materials Price Index (1935-1939=100)

This index, which was first published in 1949, was developed to meet the need for a measurement of the price change of that part of housing costs represented by materials. In addition to the composite index which measures the price change of all materials used in residential construction, price indexes are published for nine component material groups. The weights for individual material items and groups of items within the index were based on the estimated material requirement for a national housing target for the year 1946, and the index was calculated on the base 1935-1939=100. However, to facilitate comparisons of its movements with those of the new non-residential series, table 2 shows it arithmetically converted to the base 1949=100. Additional information concerning this index may be found in the special bulletin "Price Index Numbers of Residential Building Materials, 1926 to 1948", obtainable for 10 cents on request to the Dominion Statistician.

As a first step in a revision program, the structure of the Residential Electrical Equipment and Fixtures index has been revised. Both items priced and weights have been brought into line with latest available data on current building practices. The price reference base will continue as 1935-1939=100. For the new weighting diagram effective from July 1959 see "Prices and Price Indexes, August 1959".

Retail Price Indexes

Consumer Price Index

The Consumer Price Index was constructed to replace the Cost-of-Living Index and was first published October 23, 1952.

While the Consumer Price Index is an entirely new index constructed from post-war expenditure patterns, it serves the same purpose as the Cost-of-Living Index. That is, it measures the average percentage change in retail prices of goods and services bought by a large and representative group of Canadian urban families. The change in title was made to clarify the fact that the index is a measure of price change and is not affected by changes in standards of living.

In a special report entitled "The Consumer Price Index, January 1949-August 1952", (1) the Bureau published an explanation of the construction of the new index and a record of its movements from January 1949 to August 1952. This report contains detailed information on such aspects of the new index as purpose, family coverage, base period, and details of items included as well as their relative importance. It also gives the formula used in calculating the index, outlines methods of price collection and explains special features of the index, such as the methods of incorporating seasonal variations in food consumption, and changes in the price element of home-ownership costs.

Nineteen forty-nine was selected as a reference level or base period for the Consumer Price Index for a variety of reasons. It is the most satisfactory post-war reference year, not only for price index comparisons, but also for other economic indicators. In addition, prices during 1949 were relatively stable. Dating from the termination of World War II there has been a steady shift of interest from pre-war to post-war comparisons in all fields of economic activity. Conditions have changed greatly since 1935-1939 and concern with things as they existed at that time has steadily declined. These circumstances are similar to those which led to the abandonment of 1900, 1913, and 1926 as base periods.

The index is based on goods and services reported purchased during the year ending August 31, 1948 by 1,517 families, representing all Canadian families with the following characteristics: (a) living in 27 Canadian cities with over 30,000 population; (b) ranging in size from two adults to two adults with four children; (c) with annual incomes during the survey year ranging from \$1,650 to \$4,050.

To measure the influence of price change on the cost of goods and services purchased by such families, the Consumer Price Index contains 224 items.

Consumer Price Indexes for Regional Cities: Consumer Price Indexes are published monthly in this bulletin for the following cities or city combinations: St. John's, Halifax, Saint John, Montreal, Ottawa, Toronto, Winnipeg, Saskatoon-Regina, Edmonton-Calgary and Vancouver. With the exception of the index for St. John's, Newfoundland, which is constructed on the base June 1, 1951 = 100, all indexes are on the base 1949 = 100. The regional indexes with the exception of the one for St. John's, are patterned after the Consumer Price Index for Canada. They are similar to this index in terms of family coverage, item content and weighting system.

These indexes fulfill the same purpose as the cost-of-living series which they replace, viz.: each index is designed to measure the influence of changes in retail prices taking place in the localities specified, upon the cost of a fixed basket of goods and services representing the level of consumption of a representative group of families in those particular areas.

(1) Available in French under the title "L'Indice des Prix à la Consommation Janvier 1949-Août 1952". (These reports obtainable for twenty-five cents each).

In using the city indexes, it should be remembered that they are not indicators of comparative levels of prices as between the cities. That is, they do not in any way indicate whether prices are higher or lower in one city than in another. This fact may be illustrated by reference to temperature changes occurring in two cities. Suppose that in city A the temperature increases by 20 per cent from Time 1 to Time 2, and that in city B it increases 30 per cent during the same interval. In this instance an index of temperature change for City A would be 120 at Time 2 when Time 1 = 100, and the corresponding index for city B would be 130. From these indexes, it is obviously impossible to say whether or not it is warmer or colder in city A or city B. While the indexes form valid measurements of temperature change, they do not in any way indicate the comparative levels of temperature.

Price Index Numbers of Commodities and Services Used by Farmers: The index of Commodities and Services used by Farmers is designed to measure the change in retail prices of farm operating costs and farm living costs. It is calculated thrice yearly, viz.: January, April and August, and is on the base 1935-39=100. For an explanation of methods of construction and an historical record, please refer to "Price Index Numbers of Commodities and Services Used by Farmers, 1913 to 1948 (Revised 1948)." A special bulletin giving total and group index detail is released subsequent to each pricing date.

Security Price Indexes

Price index numbers of industrial, utility, bank and mining common stocks, and preferred stocks are calculated from Montreal and Toronto exchange quotations. The indexes are designed to reflect weekly and monthly changes of interest to the investor, rather than day-to-day changes of more speculative interest. Individual stock prices are weighted by the number of shares outstanding in January of each year. The list is reviewed completely in January of each year, when new series are introduced and series of declining importance are discontinued. The Investors Index of 93 Common Stocks and the Mining Stocks Index are based on the average of the Thursday closing prices. The Preferred Stock Index is a monthly average of daily quotations.

Four additional indexes of common stock prices, relating to important categories of stocks not covered by existing series, were introduced May 1960. These will be published as interim indexes pending complete revision of the security price indexes. The price reference date for the new series is 1956; construction and weighting methods conform to those of existing indexes.

Measuring the Purchasing Power of Earnings

Changing consumer price levels affect the amounts of goods and services which a dollar will buy, and average earnings, of course, will be affected in the same way. An earnings measurement which takes the change of consumer prices into account, can be calculated by reducing actual earnings averages by the percentage amounts consumer price levels rise, or increasing them by the amount price levels fall. The adjusted averages may be used to indicate the comparative quantities of goods and services which could be purchased by average earnings if consumer price levels had remained constant. The following illustration shows how this kind of adjustment can be made.

Suppose that a series of weekly average wages rises from \$50.00 in week A to \$60.00 in week B, and that in the same interval a consumer price index advances from 100.0 to 110.0. Because of the 10 per cent rise in consumer prices, \$1.00 will not buy as much in week B as it would in week A. Likewise, the 20 per cent rise from \$50.00 to \$60.00 will overstate the increase which has occurred in the purchasing power of average weekly wages. This overstatement can be removed by reducing the figure of \$60.00 by the amount of the consumer price increase. An adjusted average of \$55.00 ($\$60.00/110.0 \times 100.0$), may be referred to as a weekly wage average for week B, expressed in the dollars of period A, or it may be said to indicate the level of real weekly wages relative to week A.

The foregoing calculation can be carried a step further to express in index number form the relationship between the week A average of \$50.00 and the week B figure of \$55.00. Taking the week A average of \$50.00 as equal to 100.0, the week B index becomes 110.0 ($\$55.00/50.00 \times 100.0$). Such an index may be called an index of weekly real wages. It indicates that average wages for week B will buy 10 per cent more goods and services than those received in week A, in spite of a 10 per cent rise in consumer prices. This 10 per cent increase in real wages compares with the rise of 20 per cent in money wages ($\$60.00/50.00 \times 100.0$).

It should be noted that while the estimates of average real wages may reflect the experience of broad groups of workers fairly well, their applicability to individual wage earners depends upon a number of considerations. For example, individual earnings will differ significantly from the group average, depending upon occupation, industry, geographical location, or the sex of the wage earner. Moreover, individual spending habits differ widely, while the consumer price index which is used to adjust the earnings data is based on the average consumption pattern of a large group of urban population. Also, group-spending patterns change over periods of time. To the extent that this occurs, the earnings data adjusted by the consumer price index (which has a "fixed" consumption pattern), will gradually be rendered less valid. Finally, some part of income is saved, and it should be borne in mind that it is not appropriate to reduce savings to a constant dollar basis by using a price which reflects consumption patterns.

It should also be kept in mind that measures of change in real earnings calculated from averages of gross earnings may differ from changes in the purchasing power of "take-home" pay, due to such factors as changes in personal income tax and pay deductions for such things as social insurance and pension plans. Neither do they take into account other family income, or changes in the savings position of families. Thus index numbers of real wages should not be interpreted as measuring fluctuations in the levels of consumption of wage-earners or wage-earners' families; they are intended to show only the trend in purchasing power of wages over the items covered by the price index.

In Table 13, page 39 figures for 1949 are used as reference levels for indexes of both actual and real wages, since this is the year selected by the Dominion Bureau of Statistics for general post-war index number comparisons. However, the adjustment made in the foregoing illustration can be applied to any reference level, and it should not be inferred that the 1949 reference period has any special validity for earnings comparisons. Percentage change between any two periods will be the same regardless of the reference period selected.

Weekly Wages in Current Dollars relate to the last pay periods in the month, while the Consumer Price Index relates to the beginning of the month. In calculating Weekly Wages in 1949 Dollars, the Weekly Wages in Current Dollars for any month are therefore adjusted by the Consumer Price Index for the following month as being more representative of the period in which the wages are spent.

Spatial Retail Food Price Indexes for Selected Canadian Cities

1956-59

For some years the Dominion Bureau of Statistics has been investigating the problems of calculating indexes which will indicate, with some precision, the extent of the differences in the average level of retail prices between major Canadian cities. In commodities and services other than food, problems of comparability of items are of major significance and it has not yet been possible to cover these areas of family budgets.

In foods, however, the problem of comparability of items between cities is at a minimum, and it has been possible to calculate indexes which are considered to indicate the extent of the difference in the average level of retail food prices between Winnipeg and 10 other major Canadian cities with sufficient reliability. These have been calculated annually for 1956, 1957, 1958 and 1959, and will be maintained on an annual basis in the future.

These indexes have been calculated on the basis of prices collected in each of the eleven cities, weighted in accordance with average urban food expenditures as contained in the weighting diagram of the Canada Consumer Price Index. Because of the differences in food purchases between cities it is impossible to calculate entirely accurate measurements. The closest approximation would be derived, for example, from the use of both Winnipeg and Vancouver weights in the calculation of the Winnipeg-Vancouver comparison, rather than the use of average urban food expenditures. However, the calculation of a number of indexes using weights relating to each city did not produce indexes significantly different from those which appear in Table 14 on page 39. This reflects the fact that while differences in food purchases exist, the magnitude of the differences in the cities covered is not such as to affect spatial comparisons significantly.

In addition to the problem of weights, the difficulty of obtaining prices for identically the same description of each food item in each city is of some consequence. While considerable care is taken to minimize differences due to variations in quality of the items priced, it is impossible to completely eliminate all such variations. This is particularly true in the case of beef items, where variations in consumption by grades as between cities undoubtedly affect the resultant price comparisons.

While these indexes have been expressed in terms of Winnipeg = 100, the selection of Winnipeg as the base city has no significance, and the indexes may be expressed on the base of any of the eleven cities included.
