NOTES ON PRICES AND PRICE INDEX NUMBERS

General Wholesale Index (1935-39=100)

The General Wholesale Index eased to 230.9 in April, 0.2 per cent below the March index of 231.3 and about the same amount lower than the April 1960 index of 231.5. Four of the major group indexes declined in April and outweighed the increases of the remaining four which advanced from March.

Lower prices in April for livestock, fresh and cured meats, fishery products, dressed fowl, eggs, and lard were mainly responsible for a drop of 2.0 per cent from 256.2 to 251.0 in the Animal Products Group index. The Non-metallic Minerals Group index moved down 1.0 per cent from 186.3 to 184.5 due chiefly to lower coal prices. The Textile Products Group index declined slightly from 233.1 to 232.8, and the Chemical Products Group index at 188.0 was practically unchanged from the March index of 188.1.

The Iron Products Group index advanced 0.9 per cent to 259.1 in April from the March index of 256.7. The increase was chiefly attributable to higher prices for scrap iron and steel. Increases of 0.2 per cent or less occurred in three major group indexes: Vegetable Products from 200.1 to 200.6; Wood Products from 301.6 to 302.3; Non-ferrous Metals from 174.6 to 174.7.

The following table shows some of the more noteworthy changes:

### Industry Selling Price Indexes (1956=100)

In 25 manufacturing industries, Industry Selling Price Indexes were higher in April than in March, an increase of 6 from the preceding month-to-month comparison in March, when 19 indexes were up from February levels. In the March-April period the industries which increased out-numbered those for which decreases were recorded 25 to 17. This was a strengthening of the same tendency in the similar comparison for the February-March period when the price levels of 19 industries were higher and 18 were lower than in February. In April, 56 of the 98 industry indexes remained unchanged, 5 less than in March when 61 industries maintained identical levels from February.

There were two major industry groups, Textile Mills Industries and Wood Products Industries in which more than one-half of the component indexes were higher over the period. On the other hand, industry indexes which declined from March to April were in the minority in most major groups although 6 industries in the Foods and Beverages Industries were lower.

The average level of the 98 indexes in April was 102.8, up slightly from the March level of 102.6. The median was 103.8 (half of the indexes were above 103.8 and the other half below 103.8) also slightly higher than the March median of 103.6.

The following table summarizes March-April price movements by major industry group:

### Canadian Farm Products Price Index (1935-39=100)

The price index of Canadian Farm Products at terminal markets moved down 1.5 per cent from 216.2 to 213.0 between March and April. The Animal Products index declined 2.5 per cent from 269.9 to 263.1 reflecting lower prices on both Eastern and Western markets for hogs, eggs, and steers, and for poultry in the East. Higher prices were reported for raw wool and calves both East and West, and for lambs in the East. The Field Products index was up fractionally, rising 0.2 per cent from 162.4 to 162.8, as increased prices for hay and flax in the West and for peas and potatoes in the East were almost offset by lower prices for rye and potatoes in the West, and for corn, oats and wheat in the East.

### Thirty Industrial Materials Price Index (1935-39=100)

The index of 30 industrial materials, calculated as an unweighted geometric average, advanced 0.8 per cent from 240.1 to 241.7 between March and April. Price advances for 12 commodities were led by

steel scrap, raw wool, fir lumber, tin, raw sugar, raw rubber and linseed oil. Showing lower were hogs, beef hides, sisal and steers.

#### Security Price Indexes

The Investors Index of 92 common stock prices (1935-39=100) between March and April rose 3.5 per cent from 294.6 to 304.8, its highest level to date. Increases for major groups were 4.0 per cent for 71 Industrials, from 307.4 to 319.6; 1.6 per cent for 7 Banks, from 371.8 to 377.6; and 1.3 per cent for 14 Utilities, from 206.2 to 208.8. Eight Industrial sub-groups advanced, with gains led by Industrial Mines (6.0 per cent), Machinery and Equipment (5.5 per cent), and Food and Allied Products (5.3 per cent). Milling and Grains moved fractionally lower. In Utilities, Transportation and Telephones were higher while Power and Traction showed a small loss.

The index of 27 Mining Stocks (1935-39=100) rose 3.8 per cent from 112.3 to 116.6 in the same period, reflecting a 7.2 per cent gain for 6 Base Metals from 203.6 to 218.2, and a loss of 0.4 per cent for 21 Golds from 72.4 to 72.1.

Four supplementary indexes (1956=100) showed changes as follows: 5 Pipelines, up 8.1 per cent from 127.6 to 137.9; 5 Investment and Loan, up 6.7 per cent from 154.4 to 164.8; 7 Uraniums, up 2.0 per cent from 68.6 to 70.0; and 9 Primary Oils and Gas, down 0.2 per cent from 60.0 to 59.9.

The index of 27 Preferred issues (1935-39=100) rose 1.2 per cent from 157.7 to 159.6.

#### The Consumer Price Index (1949=100)

The Consumer Price Index was unchanged at 129.1 between March and April 1961. Declines in the Food, and Recreation and Reading components balanced increases in the Clothing, Health and Personal Care, and Tobacco and Alcohol components. The Housing and Transportation components were unchanged.

The April indexes reflect the Nova Scotia sales tax changes which became effective in April as well as the gasoline tax changes in Nova Scotia, New Brunswick, Saskatchewan, Alberta and British Columbia.

The Food index declined 0.1 per cent from 124.0 to 123.9 as prices of food for consumption at home decreased 0.2 per cent but restaurant meals increased 0.3 per cent. Lower prices were reported for eggs, beef, pork, veal, turkey, powdered skim milk, bananas, grapefruit and chocolate bars. Prices were higher for most fats, oranges, cereal products other than bread, apples and most fresh, canned and frozen vegetables, particularly fresh tomatoes and lettuce.

The Housing index was unchanged at 133.2. A fractional increase in the shelter component, combined with no change in the household operation component, was not sufficient to change the combined index. The shelter index was higher as a result of price increases for some items of home-ownership. The rent index was unchanged, as the stability which has been evident in this series for some months continued. In the household operation index, lower prices for some household appliances offset higher prices for furniture, floor coverings, textiles, and utensils and equipment.

The Clothing index increased 0.1 per cent from 111.8 to 111.9 as a result of higher prices for men's, women's, and children's wear, and piece goods. Clothing services, which include laundry, dry cleaning and shoe repairs, and footwear were unchanged.

The Transportation index was unchanged at 141.0 with little or no price movement in the automobile operation, local transportation or travel indexes. In automobile operation, tax increases for gasoline in a number of cities were largely offset by substantial price decreases in several cities, particularly Toronto. Automobile licenses cost more in a number of cities.

The Health and Personal Care index rose 0.6 per cent from 154.4 to 155.3. Higher professional fees occurred for dentists' and doctors' services and for optical care. In personal care, prices of supplies were lower as decreases for toilet soap outweighed slightly higher prices for other items.

The Recreation and Reading index declined 0.8 per cent from 146.6 to 145.5. The reading index was unchanged but the recreation index decreased as a result of lower prices for television sets, radios, phonograph records and bicycles.

The fractional increase of 0.1 per cent in the Tobacco and Alcohol index from 115.7 to 115.8 resulted entirely from price changes in Saint John for both beer and liquor.

Wholesale Price Indexes

Canadian Farm Products

Wheat prices used in this index are buying prices of the Canadian Wheat Board, for Nos. 1, 2 and 3, Manitoba Northern at Fort William-Port Arthur. The initial payment price is first used and revised as further payments are announced.

Final wheat participation payments for the crop year August 1958-July 1959 were announced June 15, 1960. The price of No. 1 Manitoba Northern was adjusted to \$1.594 per bushel, No. 2 to \$1.559 and No. 3 to \$1.483, and the indexes revised accordingly. For the crop year 1959-1960, the initial payment of \$1.40 for No. 1 Manitoba Northern was increased to \$1.50 as of February 14, 1961. Subsequent indexes are based on an initial payment of \$1.40.

Commencing August 1, 1949, Western oats and barley were brought under control of the Canadian Wheat Board. Prices used for Canadian Farm Products since that time have been initial payments to farmers, with participation payments included whenever they are announced. For the crop year 1959-1960 final payment announced February 14, 1961, brought the price to \$.771 per bushel for No. 2 C.W. oats; final payment announced April 20, 1961 brought the price to \$.882 per bushel for No. 1 Feed barley. Initial payment for the crop year 1960-1961 was \$.60 for No. 2 C.W. oats and \$.87 for No. 1 Feed barley.

For final revised indexes August 1945 to July 1952 see Prices and Price Indexes, May 1953, Table 21. For subsequent years see Table 4 of February 1954, May 1955 and 1956, and Table 2 of May 1957, May 1958, and July 1959. Indexes subsequent to July 1959 are subject to revision.

The Non-Residential Building Materials Price Index (1949=100)

A second special purpose price index related to the construction industry entitled "Non-Residential Building Materials Price Index" is shown in Table 8. This index has been constructed specifically to measure the price change of materials used in non-residential building construction. It supplements a price index applicable to materials used in residential construction which has been available for some years. The new index has been constructed on the base 1949=100, using weights obtained from data on cost of building materials provided by general and trade contractors for a sample of buildings constructed in Canada during the years 1948-1950.

The methods of constructing the index are explained in some detail in D.B.S. Reference Paper No. 43, entitled "Non-Residential Building Materials Price Index, 1935-1952", which was released on August 21, 1953 and which is available for the sum of 25 cents on request to the Dominion Statistician. This publication also comments on the uses and limitations of the index, and provides the total index by years from 1935 to 1952, and by months for the period January 1949-July 1953. Price indexes for twelve principal component material groups have been calculated by months from January 1949 to July 1953 and these indexes are also contained in the above mentioned publication.

The Residential Building Materials Price Index (1935-1939=100)

This index, which was first published in 1949, was developed to meet the need for a measurement of the price change of that part of housing costs represented by materials. In addition to the composite index which measures the price change of all materials used in residential construction, price indexes are published for nine component material groups. The weights for individual material items and groups of items within the index were based on the estimated material requirement for a national housing target for the year 1946, and the index was calculated on the base 1935-1939=100. However, to facilitate comparisons of its movements with those of the new non-residential series, table 2 shows it arithmetically converted to the base 1949=100. Additional information concerning this index may be found in the special bulletin "Price Index Numbers of Residential Building Materials, 1926 to 1948", obtainable for 10 cents on request to the Dominion Statistician.

As a first step in a revision program, the structure of the Residential Electrical Equipment and Fixtures index has been revised. Both items priced and weights have been brought into line with latest available data on current building practices. The price reference base will continue as 1935-1939=100. For the new weighting diagram effective from July 1959 see "Prices and Price Indexes, August 1959".

### Retail Price Indexes

#### Consumer Price Index

The Consumer Price Index was constructed to replace the Cost-of-Living Index and was first published October 23, 1952, on a time base 1949=100 and weights based on family expenditure patterns of 1947-48. A revision of the Consumer Price Index on the basis of 1957 expenditures while retaining the time base 1949-100, was released in an occasional paper on March 21, 1961 and the revised 1957-weighted index became the official measurement of price change forward from January 1961. The purpose of this latest revision was to bring the items included in the index, and their weights, into line with current family spending patterns.

The Consumer Price Index measures the percentage change through time in the cost of purchasing a constant "basket" of goods and services representing the purchases made by a particular population group in a specified time period. The basket is a constant or equivalent quantity and quality of goods and services but only items for which there is a continually measurable market price over time, corresponding to a specific quantity of the item, are included in the basket.

The index relates to a broad but specific group of urban families and reflects the price changes experienced by that "target group". The index is unlikely to represent closely the experience of any one family within the group nor should it be expected to reflect price change for other population groups for which income, family size and place of residence are characteristically different. The target group to which the revised index relates is composed of families - (a) living in cities with over 30,000 population, (b) ranging in size from two adults to two adults with four children, and (c) with annual incomes during 1957 ranging from \$2,500 to \$7,000.

To measure the influences of price change on the cost of goods and services purchased by such families, the Consumer Price Index contains some 300 items.

Full details on the revised index are available in the occasional paper "The Consumer Price Index for Canada (1949=100) - Revision Based on 1957 Expenditures", D.B.S. Catalogue Number 62-518.

Consumer Price Indexes for Regional Cities: Consumer Price Indexes are published monthly in this bulletin for the following cities or city combinations: St. John's, Halifax, Saint John, Montreal, Ottawa, Toronto, Winnipeg, Saskatoon-Regina, Edmonton-Calgary and Vancouver. With the exception of the index for St. John's, Newfoundland, which is constructed on the base June 1, 1951 = 100, all indexes are on the base 1949 = 100. The regional indexes with the exception of the one for St. John's, are patterned after the Consumer Price Index for Canada. They are similar to this index in terms of family coverage, item content and weighting system.

These indexes fulfill the same purpose as the cost-of-living series which they replace, viz.: each index is designed to measure the influence of changes in retail prices taking place in the localities specified, upon the cost of a fixed basket of goods and services representing the level of consumption of a representative group of families in those particular areas.

In using the city indexes, it should be remembered that they are not indicators of comparative levels of prices as between the cities. That is, they do not in any way indicate whether prices are higher or lower in one city than in another. This fact may be illustrated by reference to temperature changes occurring in two cities. Suppose that in city A the temperature increases by 20 per cent from Time 1 to Time 2, and that in city B it increases 30 per cent during the same interval. In this instance an index of temperature change for City A would be 120 at Time 2 when Time 1 = 100, and the corresponding index for city B would be 130. From these indexes, it is obviously impossible to say whether or not it is warmer or colder in city A or city B. While the indexes form valid measurements of temperature change, they do not in any way indicate the comparative levels of temperature.

Price Index Numbers of Commodities and Services Used by Farmers: The index of Commodities and Services used by Farmers is designed to measure the change in retail prices of farm operating costs and farm living costs. It is calculated thrice yearly, viz.: January, April and August, and is on the base 1935-39=100. For an explanation of methods of construction and an historical record, please refer to "Price Index Numbers of Commodities and Services Used by Farmers, 1913 to 1948 (Revised 1948)." A special bulletin giving total and group index detail is released subsequent to each pricing date.

#### Security Price Indexes

Price index numbers of industrial, utility, bank and mining common stocks, and preferred stocks are calculated from Montreal and Toronto exchange quotations. The indexes are designed to reflect weekly and monthly changes of interest to the investor, rather than day-to-day changes of more speculative interest. Individual stock prices are weighted by the number of shares outstanding in January of each year. The list is reviewed completely in January of each year, when new series are introduced and series of declining importance are discontinued. The Investors Index of 92 Common Stocks and the Mining Stocks Index are based on the average of the Thursday closing prices. The Preferred Stock Index is a monthly average of daily quotations.

Four additional indexes of common stock prices, relating to important categories of stocks not covered by existing series, were introduced May 1960. These will be published as interim indexes pending complete revision of the security price indexes. The price reference date for the new series is 1956; construction and weighting methods conform to those of existing indexes.

#### Measuring the Purchasing Power of Earnings

Changing consumer price levels affect the amounts of goods and services which a dollar will buy, and average earnings, of course, will be affected in the same way. An earnings measurement which takes the change of consumer prices into account, can be calculated by reducing actual earnings averages by the percentage amounts consumer price levels rise, or increasing them by the amount price levels fall. The adjusted averages may be used to indicate the comparative quantities of goods and services which could be purchased by average earnings if consumer price levels had remained constant. The following illustration shows how this kind of adjustment can be made.

Suppose that a series of weekly average wages rises from \$50.00 in week A to \$60.00 in week B, and that in the same interval a consumer price index advances from 100.0 to 110.0. Because of the 10 per cent rise in consumer prices, \$1.00 will not buy as much in week B as it would in week A. Likewise, the 20 per cent rise from \$50.00 to \$60.00 will overstate the increase which has occurred in the purchasing power of average weekly wages. This overstatement can be removed by reducing the figure of \$60.00 by the amount of the consumer price increase. An adjusted average of \$55.00 ( $\$60.00 / 110.0 \times 100.0$ ), may be referred to as a weekly wage average for week B, expressed in the dollars of period A, or it may be said to indicate the level of real weekly wages relative to week A.

The foregoing calculation can be carried a step further to express in index number form the relationship between the week A average of \$50.00 and the week B figure of \$55.00. Taking the week A average of \$50.00 as equal to 100.0, the week B index becomes 110.0 ( $\$55.00 / \$50.00 \times 100.0$ ). Such an index may be called an index of weekly real wages. It indicates that average wages for week B will buy 10 per cent more goods and services than those received in week A, in spite of a 10 per cent rise in consumer prices. This 10 per cent increase in real wages compares with the rise of 20 per cent in money wages ( $\$60.00 / \$50.00 \times 100.0$ ).

It should be noted that while the estimates of average real wages may reflect the experience of broad groups of workers fairly well, their applicability to individual wage earners depends upon a number of considerations. For example, individual earnings will differ significantly from the group average, depending upon occupation, industry, geographical location, or the sex of the wage earner. Moreover, individual spending habits differ widely, while the consumer price index which is used to adjust the earnings data is based on the average consumption pattern of a large group of urban population. Also, group-spending patterns change over periods of time. To the extent that this occurs, the earnings data adjusted by the consumer price index (which has a "fixed" consumption pattern), will gradually be rendered less valid. Finally, some part of income is saved, and it should be borne in mind that it is not appropriate to reduce savings to a constant dollar basis by using a price which reflects consumption patterns.

It should also be kept in mind that measures of change in real earnings calculated from averages of gross earnings may differ from changes in the purchasing power of "take-home" pay, due to such factors as changes in personal income tax and pay deductions for such things as social insurance and pension plans. Neither do they take into account other family income, or changes in the savings position of families. Thus index numbers of real wages should not be interpreted as measuring fluctuations in the levels of consumption of wage-earners or wage-earners' families; they are intended to show only the trend in purchasing power of wages over the items covered by the price index.

In Table 13, page 41 figures for 1949 are used as reference levels for indexes of both actual and real wages, since this is the year selected by the Dominion Bureau of Statistics for general post-war index number comparisons. However, the adjustment made in the foregoing illustration can be applied to any reference level, and it should not be inferred that the 1949 reference period has any special validity for earnings comparisons. Percentage change between any two periods will be the same regardless of the reference period selected.

Weekly Wages in Current Dollars relate to the last pay periods in the month, while the Consumer Price Index relates to the beginning of the month. In calculating Weekly Wages in 1949 Dollars, the Weekly Wages in Current Dollars for any month are therefore adjusted by the Consumer Price Index for the following month as being more representative of the period in which the wages are spent.

Spatial Retail Food Price Indexes for Selected Canadian Cities

1956-59

For some years the Dominion Bureau of Statistics has been investigating the problems of calculating indexes which will indicate, with some precision, the extent of the differences in the average level of retail prices between major Canadian cities. In commodities and services other than food, problems of comparability of items are of major significance and it has not yet been possible to cover these areas of family budgets.

In foods, however, the problem of comparability of items between cities is at a minimum, and it has been possible to calculate indexes which are considered to indicate the extent of the difference in the average level of retail food prices between Winnipeg and 10 other major Canadian cities with sufficient reliability. These have been calculated annually for 1956, 1957, 1958 and 1959, and will be maintained on an annual basis in the future.

These indexes have been calculated on the basis of prices collected in each of the eleven cities, weighted in accordance with average urban food expenditures as contained in the weighting diagram of the Canada Consumer Price Index. Because of the differences in food purchases between cities it is impossible to calculate entirely accurate measurements. The closest approximation would be derived, for example, from the use of both Winnipeg and Vancouver weights in the calculation of the Winnipeg-Vancouver comparison, rather than the use of average urban food expenditures. However, the calculation of a number of indexes using weights relating to each city did not produce indexes significantly different from those which appear in Table 14 on page 41. This reflects the fact that while differences in food purchases exist, the magnitude of the differences in the cities covered is not such as to affect spatial comparisons significantly.

In addition to the problem of weights, the difficulty of obtaining prices for identically the same description of each food item in each city is of some consequence. While considerable care is taken to minimize differences due to variations in quality of the items priced, it is impossible to completely eliminate all such variations. This is particularly true in the case of beef items, where variations in consumption by grades as between cities undoubtedly affect the resultant price comparisons.

While these indexes have been expressed in terms of Winnipeg = 100, the selection of Winnipeg as the base city has no significance, and the indexes may be expressed on the base of any of the eleven cities included.

## **SYMBOLS**

The interpretation of the symbols used in the tables throughout this insert is as follows:

- nil or zero.
- .. figures not available.
- amount too small to be expressed or where "a trace" is meant.

## **SERVICE**

Full — heated, stove and refrigerator.

Partial — any two of above.
