NOTES ON PRICES AND PRICE INDEX NUMBERS

Industry Selling Price Indexes (1956=100)

In 31 manufacturing industries, Industry Selling Price Indexes were higher in February than in January, 13 fewer than the 44 increases recorded in the December-January period. The industry indexes which declined in February numbered 10, compared to 35 decreases in January. Of the 102 industries, 61 were unchanged in February, 38 more than in January when 23 remained the same.

The average level of the 102 industry indexes in February was 108.4, higher than the January average of 108.2. The median was also slightly higher than in January, edging up to 108.2 from 108.1.

The following table summarizes January-February price movements by major industry group:

General Wholesale Index (1935-39=100)

The General Wholesale Index eased down to 246.6 in February, 0.1 per cent lower than the January index of 246.8, but was 0.2 per cent higher than the February 1964 index of 246.2. Four major group indexes moved down in February, while three advanced. The remaining one, the Iron Products Group index was unchanged at 259.3.

The Vegetable Products Group index declined 2.4 per cent to 218.3 in February from the January index of 223.7, mainly on lower prices for unmanufactured tobacco, grains, livestock and poultry feeds, sugar and its products, and fresh fruits. Decreases of 0.2 per cent or less were recorded for the following major group indexes: Chemical Products to 192.4 from 192.8, Non-ferrous Metals to 212.3 from 212.6, and Textile Products to 247.9 from 248.0

Price increases for livestock, fresh and cured meats, fishery products, eggs, and hides and skins were chiefly responsible for an advance of 1.9 per cent in the Animal Products Group index to 256.2 from 251.5. The Non-metallic Minerals Group index rose 1.7 per cent in February to 192.2 from 188.9, mainly due to higher gasoline prices at Toronto. The Wood Products Group index eased upward to 333.1 from 333.0.

The following table shows some of the more noteworthy changes:

Canadian Farm Products Price Index (1935-39=100)

The price index of Canadian Farm Products at terminal markets moved up 1.1 per cent from 222.5 to 224.9 between January and February. The Animal Products index advanced 2.0 per cent from 262.5 to 267.7 reflecting price increases for lambs, eggs and hogs on both Eastern and Western markets, poultry in the East and steers in the West. Prices were lower for raw wool and calves on both markets. The Field Products index eased 0.2 per cent from 182.5 to 182.1 reflecting lower prices for tobacco in the East. Higher prices were reported for rye, hay and potatoes on both markets, corn, peas, barley and wheat in the East and flax in the West.

Thirty Industrial Materials Price Index (1935-39=100)

The index of thirty industrial materials, calculated as an unweighted geometric average eased 0.5 per cent from 256.7 to 255.3 between January and February. Prices for six commodities declined and five advanced while nineteen remained unchanged. Principal changes included decreases for tin, sisal, domestic wheat, raw wool and raw sugar, and increases for beef hides, linseed oil and hogs.

Security Price Indexes (1956=100)

The Investors Index of common stocks edged 0.3 per cent from 177.2 to 177.8 between January and February. Among the three major groups, Industrials advanced 0.6 per cent from 181.0 to 182.0, Finance increased 1.4 per cent from 162.7 to 164.9 and Utilities eased 0.9 per cent from 173.5 to 172.0. Within Industrials, indexes for ten of the thirteen sub-groups advanced and three declined. Gains were headed by Construction up 3.2 per cent from 85.2 to 87.9 and Beverages up 2.8 per cent from 243.5 to 250.3 while slight losses were recorded for Industrial Mines, Primary Metals and Textiles and Clothing. Both sub-groups in Finance showed gains as Investment and Loan rose 1.6 per cent from 184.8 to 187.7 and Banks advanced 1.2 per cent from 151.0 to 152.8. In Utilities, four of the five sub-groups showed losses headed by Pipelines down 2.7 per cent from 196.2 to 190.9 and Telephone down 2.6 per cent from 148.4 to 144.5. Transportation rose 5.2 per cent from 202.6 to 213.1.

The Mining stock index eased 0.5 per cent from 118.2 to 117.6 reflecting a decrease of 3.2 per cent for Golds from 142.6 to 138.0 and an increase of 1.6 per cent for Base Metals from 104.8 to 106.5.

The two supplementary indexes advanced with Uraniums up 9.1 per cent from 104.5 to 114.0 and Primary Oils and Gas up 2.9 per cent from 89.2 to 91.8.

The Preferred stock index rose 0.5 per cent from 106.3 to 106.8.

The Consumer Price Index (1949=100)

The Consumer Price Index for Canada increased 0.2 per cent to 137.2 at the beginning of February from 136.9 in January. The February index was 2.0 per cent higher than the February 1964 index of 134.5. Five of the seven main components increased in the current period, with the largest rise, 0.5 per cent, occurring in the Food index. The Recreation and Reading index declined 0.4 per cent, while Transportation was unchanged from last month.

The Food index rose 0.5 per cent to 133.1 from 132.5, resulting from price increases for fresh fruit and vegetables, fats other than butter and lard, some beef cuts, both fresh and cured pork, liver, lamb, veal and chicken. Prices were lower for eggs, sugar, oranges and grapefruit, canned and frozen orange juice, celery, cabbage, and lettuce.

The Housing index rose 0.2 per cent to 140.1 from 139.8. The shelter component was 0.4 per cent higher, reflecting increased prices for home-ownership and tenant repairs. Rent was unchanged. The household operation component declined 0.2 per cent as sale prices for furniture and carpeting outweighed higher prices for household supplies and cotton and wool textiles.

The Clothing index advanced 0.3 per cent to 119.5 from 119.2, mainly reflecting women's wear prices up from sale levels, and higher prices for cotton and wool piece goods, and footwear. Price changes for men's and children's wear were mixed.

The Transportation index was unchanged at 146.3. Higher prices for taxi fares in a few cities and bus fares in one city were offset by scattered lower gasoline prices.

The Health and Personal Care index edged up 0.1 per cent to 174.6 from 174.4 chiefly as a result of higher prices for personal care supplies. The health care component decreased slightly with lower prices for prescriptions and other pharmaceutical products.

The Recreation and Reading index declined 0.4 per cent to 153.4 from 154.0 as lower prices for magazine subscriptions moved the reading component down 1.6 per cent. The recreation component rose fractionally with price increases for bicycles and camera film.

The Tobacco and Alcohol index was 0.1 per cent higher at 121.8 from 121.7. Scattered price increases for cigarettes and cigarette tobacco moved the tobacco component. The component for alcoholic beverages was unchanged.

Wholesale Price Indexes

Industry Selling Price Indexes (1956=100)

Industry Selling Price Indexes are published for most of the manufacturing industries and as such are the first Canadian "wholesale" price indexes to be organized according to an industry classification. Because of their common form of organization these indexes may be used in conjunction with a whole array of related statistics such as shipments, employment and inventories, to name a few, which also conform to the Standard Industrial Classification. Thus, Industry Selling Price Indexes have a clearly defined conceptual basis which fits into a common framework of analytical statistics. For this reason and because of their relatively high standard of representativeness they are recommended over their counterpart commodity series of the General Wholesale Index for purposes relating to output of manufacturing industries. However, because Industry Selling Price Indexes are available only since 1956 (in a few cases since 1949) the General Wholesale Index and its components must still be relied upon for earlier periods.

A complete description of these indexes is contained in:

Industry Selling Price Indexes 1956-59

Catalogue No. 62-515

General Wholesale Index (1935-39=100)

The General Wholesale Index is a commodity classified index of prices. The index is "general" inasmuch as it incorporates a diverse selection of both primary and processed commodities. It is called "wholesale" because its ingredient prices relate to that broad and heterogeneous area of commodity distribution which excludes only retail trade. In fact, the term "wholesale" has more of a connotation of bulk trading than of any homogeneous level of distribution. Thus, though the index mainly includes prices of producers, it also covers transactions of "middle men" who trade in commodities of a type or in quantities characteristic of primary marketing functions.

Though general wholesale price indexes have been calculated by many countries for years there is no precise answer to the question of what such an index measures. This is so because the index cannot be associated with any adequately definable value aggregate. Unlike a consumer price index which can be identified with expenditures of household consumers, a general wholesale index covers a host of overlapping transactions sometimes involving the same ingredient in as many as three different stages of processing. Yet, conceptually, it is not a measure of the purchasing power of money because it omits significant areas of monetary transactions such as prices of land, labour, securities and services, except in so far as prices of these things are implicit in commodity prices. As a conventional summary figure, its use has tended towards a reference level against which to observe the behaviour of particular price groups such as farm products, industrial materials, building materials and the various other groupings for which indexes are published. And as an indicator of general business conditions it is usually included in the group which is regarded as approximately coincident with the business cycle. However, its main attribute now lies in its long historical continuity.

Retail Price Indexes

Consumer Price Index

The Consumer Price Index was constructed to replace the Cost-of-Living Index and was first published October 23, 1952, on a time base 1949=100 and weights based on family expenditure patterns of 1947-48. A revision of the Consumer Price Index on the basis of 1957 expenditures while retaining the time base 1949=100, was released in an occasional paper on March 21, 1961 and the revised 1957-weighted index became the official measurement of price change forward from January 1961. The purpose of this latest revision was to bring the items included in the index, and their weights, into line with current family spending patterns.

The Consumer Price Index measures the percentage change through time in the cost of purchasing a constant "basket" of goods and services representing the purchases made by a particular population group in a specified time period. The basket is a constant or equivalent quantity and quality of goods and services but only items for which there is a continually measurable market price over time, corresponding to a specific quantity of the item, are included in the basket.

The index relates to a broad but specific group of urban families and reflects the price changes experienced by that "target group". The index is unlikely to represent closely the experience of any one family within the group nor should it be expected to reflect price change for other population groups for which income, family size and place of residence are characteristically different. The target group to which the current index relates is composed of families - (a) living in cities with over 30,000 population, (b) ranging in size from two adults to two adults with four children, and (c) with annual incomes during 1957 ranging from \$2,500 to \$7,000.

To measure the influences of price change on the cost of goods and services purchased by such families, the Consumer Price Index contains some 300 items.

Full details on the revised index are available in the occasional paper "The Consumer Price Index for Canada (1949=100) - Revision Based on 1957 Expenditures", D.B.S. Catalogue Number 62-518.

Consumer Price Indexes for Regional Cities: Consumer Price Indexes are published monthly in this bulletin for the following cities or city combinations: St. John's, Halifax, Saint John, Montreal, Ottawa, Toronto, Winnipeg, Saskatoon-Regina, Edmonton-Calgary and Vancouver. With the exception of the index for St. John's, Newfoundland, which is constructed on the base June 1951 = 100, all indexes are on the base 1949 = 100. The regional indexes are patterned after the Consumer Price Index for Canada. They are similar to this index in terms of family coverage, item content and weighting system.

These indexes fulfil the same purpose as the cost-of-living series which they replace, viz.: each index is designed to measure the influence of changes in retail prices taking place in the localities specified, upon the cost of a fixed basket of goods and services representing the level of consumption of a representative group of families in those particular areas.

In using the city indexes, it should be remembered that they are not indicators of comparative levels of prices as between the cities. That is, they do not in any way indicate whether prices are higher or lower in one city than in another. This fact may be illustrated by reference to temperature changes occurring in two cities. Suppose that in city A the temperature increases by 20 per cent from Time 1 to Time 2, and that in city B it increases 30 per cent during the same interval. In this instance an index of temperature change for City A would be 120 at Time 2 when Time 1 = 100, and the corresponding index for city B would be 130. From these indexes, it is obviously impossible to say whether or not it is warmer or colder in city A or city B. While the indexes form valid measurements of temperature change, they do not in any way indicate the comparative levels of temperature.

Price Index Numbers of Commodities and Services Used by Farmers: The index of Commodities and Services used by Farmers is designed to measure the change in retail prices of farm operating costs and farm living costs. It is calculated thrice yearly, viz.: January, April and August, and is on the base 1935-39=100. For an explanation of method of construction and an historical record, please refer to "Price Index Numbers of Commodities and Services Used by Farmers, 1913 to 1948 (Revised 1948)." A special bulletin giving total and group index detail is released subsequent to each pricing date.

Canadian Farm Products Index (1935-39=100)

Wheat prices used in this index are buying prices of the Canadian Wheat Board, for Nos. 1, 2 and 3, Manitoba Northern at Fort William-Port Arthur. The initial payment price is first used and revised as further payments are announced.

Final wheat participation payments for the crop year August 1962-July 1963 were announced Feb. 17, 1964. Prices for Manitoba Northern were adjusted No. 1 to \$1,871 per bushel, No. 2 to \$1,843 and No. 3 to \$1,819 and the indexes revised accordingly. Current indexes are based on initial payments for Manitoba Northern Nos. 1, 2 and 3 of \$1.50, \$1.46 and \$1.42 per bushel respectively.

Commencing August 1, 1949, Western oats and barley were brought under control of the Canadian Wheat Board. Since that time prices used for the Canadian Farm Products Index have been the initial payments to farmers, with participation payments included whenever they are announced. For the crop year 1962-63, the final payment for oats announced April 14, 1964, brought the price for No. 2 C.W. to \$.717 per bushel; for barley the final payment announced March 26, 1964, brought the price for No. 1 Feed to \$1.000 per bushel. Initial payments for the crop year 1963-64 are \$.60 per bushel for No. 2 C.W. oats, and for barley \$.87 for No. 1 Feed and \$.84 for No. 2 Feed.

For final revised indexes August 1945 to July 1952 see Prices and Price Indexes, May 1953, Table 21. For subsequent years see Table 4 of February 1954, May 1955 and 1956, and Table 2 of May 1958, July 1959, June 1960 and 1961, and Table 3 of March 1962, 1963 and 1964. Indexes subsequent to July 1963 are subject to revision.

The Non-Residential Building Materials Price Index (1949=100)

A second special purpose price index related to the construction industry entitled "Non-Residential Building Materials Price Index" is shown in Table 7. This index has been constructed specifically to measure the price change of materials used in non-residential building construction. It supplements a price index applicable to materials used in residential construction which has been available for some years. The new index has been constructed on the base 1949=100, using weights obtained from data on cost of building materials provided by general and trade contractors for a sample of buildings constructed in Canada during the years 1948-1950.

The methods of constructing the index are explained in some detail in D.B.S. Reference Paper No. 43, entitled "Non-Residential Building Materials Price Index, 1935-1952", which was released on August 21, 1953 and which is available for the sum of 25 cents on request to the Dominion Statistician. This publication also comments on the uses and limitations of the index, and provides the total index by years from 1935 to 1952, and by months for the period January 1949-July 1953. Price indexes for twelve principal component material groups have been calculated by months from January 1949 to July 1953 and these indexes are also contained in the above mentioned publication.

The Residential Building Materials Price Index (1935-1939=100)

This index, which was first published in 1949, was developed to meet the need for a measurement of the price change of that part of housing costs represented by materials. In addition to the composite index which measures the price change of all materials used in residential construction, price indexes are published for nine component material groups. The weights for individual material items and groups of items within the index were based on the estimated material requirement for a national housing target for the year 1946, and the index was calculated on the base 1935-1939=100. However, to facilitate comparisons of its movements with those of non-residential series, Table 3 shows it arithmetically converted to the base 1949=100. Additional information concerning this index may be found in the special bulletin "Price Index Numbers of Residential Building Materials, 1926 to 1948", obtainable for 10 cents on request to the Dominion Statistician,

As a first step in a revision program, the structure of the Residential Electrical Equipment and Fixtures index has been revised. Both items priced and weights have been brought into line with latest available data on current building practices. The price reference base will continue as 1935-1939=100. For the new weighting diagram effective from July 1959 see "Prices and Price Indexes, August 1959".

Security Price Indexes

Security price indexes measure through time the effect of price change on the value of a portfolio of stocks bought and held by a hypothetical investor (as opposed to the more speculative trader). The portfolio represents stocks of Canadian companies listed on Toronto, Montreal and Canadian stock exchanges. The number of shares held for each issue is in proportion to the total number of shares outstanding. Prices in the common and mining stock indexes are Thursday's closing quotations as reported in the Globe and Mail and the Montreal Gazette. For preferred stocks, prices are monthly weighted averages of the daily closing prices in which weights are daily total sales. The price reference base for the indexes is the year 1956 which has been adopted as an interim base for recently developed D.B.S. indexes. The indexes express current prices as a percentage of prices in 1956.

Revised indexes on the base 1956=100 were first presented in the June 1962 issue of this publication. The most important change in the revision of the index, apart from the shift in the price reference base, is the classification of stocks according to the Standard Industrial Classification. In the continuing major group Industrials 4 sub-groups (Milling and Grains, Food and Allied Products, Machinery and Equipment, and Building Materials) have been replaced by 8 new sub-groups (Foods, Printing and Publishing, Primary Metals, Metal Fabricating, Non-Metallic Minerals, Chemicals, Construction, and Retail Trade). The remaining 5 sub-groups of the former index, viz., Industrial Mines, Beverages, Textiles and Clothing, Pulp and Paper, and Oils (renamed Petroleum) have been continued. The major group Utilities is continued but the Pipeline index has been added as a sub-group and the previous Power and Traction sub-group has been replaced by two new sub-groups, viz., Electric Power and Gas Distribution. A new major group Finance is composed of the former major group Banks and the former supplementary index Investment and Loan. Constant weights, which were previously limited to major groups, have been extended to sub-groups. Weights in the index continue to be based on shares outstanding.

For the list of stocks currently included in the Investors Index and Preferred Index, see Prices and Price Indexes for January 1964. The following changes have occurred in the index. Faraday Uranium Mines Ltd., being exchangeable into shares of The Canadian Faraday Corp. Ltd., in February; Atlas Steels Ltd., and Consolidated Mic Mac Oils Ltd., were removed from the index in March; Consolidated Discovery Yellowknife Mines Ltd., exchangeable into shares of Discovery Mines Ltd., in May.

Price Indexes of Highway Construction (1956=100)

The Price Indexes of Highway Construction in Canada express prices paid by provincial and federal governments in contracts awarded for highway construction each year as a percentage of prices paid in 1956. Both base-weighted and current-weighted indexes are published annually. The base-weighted index measures the movement of prices through time whereas the current-weighted index measures the movement of prices only between the base year (1956) and each specified current year.

The base-weighted index measures the effect of price change on the cost of a fixed programme of highway construction in Canada represented by highway construction contracts of \$50,000 or more awarded by specified provincial governments and the federal government over the period 1956 to 1959. Weights of items in the index, representing the relative importance of units of construction in the fixed programme, are held constant. Only prices change from year to year, and the index thus measures the movement of prices through time. The base-weighted all-items index or its components are useful for planning and budgeting for highway construction programmes, in escalating or up-dating previously costed road-work, in estimating replacement costs of previously completed road-work, and as historical measurements of price trends in highway construction.

In the current-weighted index, weights of items are not held constant, as in the base-weighted index, but vary from year to year in accordance with the changing programme of highway construction. The index is designed to measure for any given year, the effect of price change since 1956 on the cost of the given year's construction programme. The index for each year expresses the cost of that year's programme of highway construction at that year's prices as a percentage of the cost of the same construction at 1956 prices. The index thus measures price changes between 1956 and the specified year. The construction programme can and does vary considerably from year to year and differences between the indexes in successive years arise partly because of price change and partly because of changes in the weights of items. Thus the current-weighted index should not be used as a measure of price change between any years except the base year (1956) and the specified given year. The main use of the current-weighted price index is in deflation of current dollar expenditures on highway construction. Changes in current dollar expenditures from year to year include both changes in prices and changes in the volume of highway construction. By deflation, price change is removed and the resulting deflated dollar expenditures (expenditures in terms of 1956 prices) reflect changes through time in the volume of highway construction expenditure.

Neither the base-weighted nor current-weighted indexes are designed to reflect the price movements of non-contract construction or maintenance work. Nor do the indexes reflect comparative price levels at different geographic locations. Thus the indexes cannot be used to compare price levels among provinces.

Prices contained in the index are not for units of labour and materials as is usually the case in construction price indexes but rather for units of construction work such as, an acre of clearing, a cubic yard of earth excavation or a ton of bituminous hot-mix paving. In addition, the index contains prices of some materials, such as culvert pipe, usually supplied to the contractor by the highway departments. Prices of construction work are annual weighted averages of bid prices of units of construction in contracts awarded, classified by price-determining characteristics of contracts, such as size, type and geographic location. Prices of material items of supply are prices paid by government departments to suppliers.

A complete description of the index is contained in the reference paper Price Indexes of Highway Construction in Canada, 1956=100, D.B.S. Catalogue No. 62-520.

Measuring the Purchasing Power of Earnings

Changing consumer price levels affect the amounts of goods and services which a dollar will buy, and average earnings, of course, will be affected in the same way. An earnings measurement which takes the change of consumer prices into account, can be calculated by reducing actual earnings averages by the percentage amounts consumer price levels rise, or increasing them by the amount price levels fall. The adjusted averages may be used to indicate the comparative quantities of goods and services which could be purchased by average earnings if consumer price levels had remained constant. The following illustration shows how this kind of adjustment can be made.

Suppose that a series of weekly average wages rises from \$50.00 in week A to \$60.00 in week B, and that in the same interval a consumer price index advances from 100.0 to 110.0. Because of the 10 per cent rise in consumer prices, \$1.00 will not buy as much in week B as it would in week A. Likewise, the 20 per cent rise from \$50.00 to \$60.00 will overstate the increase which has occurred in the purchasing power of average weekly wages. This overstatement can be removed by reducing the figure of \$60.00 by the amount of the consumer price increase. An adjusted average of \$55.00 ($\$60.00 / 110.0 \times 100.0$), may be referred to as a weekly wage average for week B, expressed in the dollars of period A, or it may be said to indicate the level of real weekly wages relative to week A.

The foregoing calculation can be carried a step further to express in index number form the relationship between the week A average of \$50.00 and the week B figure of \$55.00. Taking the week A average of \$50.00 as equal to 100.0, the week B index becomes 110.0 ($\$55.00 / \50.00×100.0). Such an index may be called an index of weekly real wages. It indicates that average wages for week B will buy 10 per cent more goods and services than those received in week A, in spite of a 10 per cent rise in consumer prices. This 10 per cent increase in real wages compares with the rise of 20 per cent in money wages ($\$60.00 / \50.00×100.0).

It should be noted that while the estimates of average real wages may reflect the experience of broad groups of workers fairly well, their applicability to individual wage earners depends upon a number of considerations. For example, individual earnings will differ significantly from the group average, depending upon occupation, industry, geographical location, or the sex of the wage earner. Moreover, individual spending habits differ widely, while the consumer price index which is used to adjust the earnings data is based on the average consumption pattern of a large group of urban population. Also, group-spending patterns change over periods of time. To the extent that this occurs, the earnings data adjusted by the consumer price index (which has a "fixed" consumption pattern), will gradually be rendered less valid. Finally, some part of income is saved, and it should be borne in mind that it is not appropriate to reduce savings to a constant dollar basis by using a price which reflects consumption patterns.

It should also be kept in mind that measures of change in real earnings calculated from averages of gross earnings may differ from changes in the purchasing power of "take-home" pay, due to such factors as changes in personal income tax and pay deductions for such things as social insurance and pension plans. Neither do they take into account other family income, or changes in the savings position of families. Thus index numbers of real wages should not be interpreted as measuring fluctuations in the levels of consumption of wage-earners or wage-earners' families; they are intended to show only the trend in purchasing power of wages over the items covered by the price index.

In Table 12, page 41 figures for 1949 are used as reference levels for indexes of both actual and real wages, since this is the year selected by the Dominion Bureau of Statistics for general post-war index number comparisons. However, the adjustment made in the foregoing illustration can be applied to any reference level, and it should not be inferred that the 1949 reference period has any special validity for earnings comparisons. Percentage change between any two periods will be the same regardless of the reference period selected.

Weekly Wages in Current Dollars relate to the last pay periods in the month, while the Consumer Price Index relates to the beginning of the month. In calculating Weekly Wages in 1949 Dollars, the Weekly Wages in Current Dollars for any month are therefore adjusted by the Consumer Price Index for the following month as being more representative of the period in which the wages are spent.

Spatial Retail Food Price Indexes for Selected Canadian Cities

1956-1964

For some years the Dominion Bureau of Statistics has been investigating the problems of calculating indexes which will indicate, with some precision, the extent of the differences in the average level of retail prices between major Canadian cities. In commodities and services other than food, problems of comparability of items are of major significance and it has not yet been possible to cover these areas of family budgets.

In foods, however, the problem of comparability of items between cities is at a minimum, and it has been possible to calculate indexes which are considered to indicate the extent of the difference in the average level of retail food prices between Winnipeg and 10 other major Canadian cities with sufficient reliability. These have been calculated annually for 1956-1964, and will be maintained on an annual basis in the future.

These indexes have been calculated on the basis of prices collected in each of the eleven cities, weighted in accordance with average urban food expenditures as contained in the weighting diagram of the Canada Consumer Price Index. Because of the differences in food purchases between cities it is impossible to calculate entirely accurate measurements. The closest approximation would be derived, for example, from the use of both Winnipeg and Vancouver weights in the calculation of the Winnipeg-Vancouver comparison, rather than the use of average urban food expenditures. However, the calculation of a number of indexes using weights relating to each city did not produce indexes significantly different from those which appear in Table 13 on page 41. This reflects the fact that while differences in food purchases exist, the magnitude of the differences in the cities covered is not such as to affect spatial comparisons significantly.

In addition to the problem of weights, the difficulty of obtaining prices for identically the same description of each food item in each city is of some consequence. While considerable care is taken to minimize differences due to variations in quality of the items priced, it is impossible to completely eliminate all such variations. This is particularly true in the case of beef items, where variations in consumption by grades as between cities undoubtedly affect the resultant price comparisons.

While these indexes have been expressed in terms of Winnipeg = 100, the selection of Winnipeg as the base city has no significance, and the indexes may be expressed on the base of any of the eleven cities included.
