NOTES ON PRICES AND PRICE INDEX NUMBERS

Industry Selling Price Indexes (1956=100)

In 33 manufacturing industries, Industry Selling Price Indexes were higher in March than in February, 5 more than the 28 increases recorded in the January-February period. Industry indexes which declined numbered 22 in March, 1 more than in February, when 21 moved down from January levels. Of the 102 industries, 47 were unchanged in March, 6 less than in February when 53 remained the same. Just over half the increases occurred in the non-ferrous metals, iron and steel, chemicals and allied products, and wood products industries, whereas the decreases were most evident in the food and beverage industry.

The average level of the 102 industry indexes in March was 116.9, up slightly from the February average of 116.6. The median was 117.0, unchanged from the previous month.

The following table summarizes February-March price movements by major industry group:

February to March Changes in Industry Indexes

Major industry group	Total	Increases			Decreases			Un-changed
	indus- tries	No.	Average %	Median %	No.	Average %	Median %	
All industries .....	102	33	1.2	0.7	22	- 0.8	- 0.3	47

General Wholesale Index (1935-39=100)

The General Wholesale Index moved up 0.4 per cent in March to 268.0 from the February index of 266.9 and was 2.1 per cent higher than the March 1967 index of 262.4. Five of the eight major group indexes were higher while three declined.

The Non-ferrous Metals Products Group index rose 2.3 per cent in March to 258.8 from the February index of 253.0 in response to notably higher prices for silver. The Wood Products Group index moved up 0.6 per cent to 360.9 from 358.7 reflecting price increases for fir, cedar, and spruce. An advance of 0.3 per cent to 230.7 from 229.9 occurred in the Vegetable Products Group index as a result of higher prices for tea, coffee and cocoa, grains, vegetable oils and raw rubber. Minor increases occurred in two major group indexes, Non-metallic Minerals Products to 204.5 from 204.1 and Iron Products to 276.5 from 276.3.

Decreases of 0.1 per cent or less occurred in the following major group indexes: Animal Products to 285.8 from 286.2, Textile Products to 255.7 from 255.9, and Chemical Products to 213.7 from 213.8.

The following table shows some of the more noteworthy changes:

Commodity group and sub-group	Percentage changes			
	Mar. 1968		Mar. 1967	
	Feb. 1968	Feb. 1967	Mar. 1968	Mar. 1967
Non-ferrous metals products group .....	+ 2.3	(1)	+ 9.4	
Silver .....	+ 31.9	+ 0.2	+ 85.5	
Wood products group .....	+ 0.6	+ 0.4	+ 5.1	
Fir .....	+ 2.6	+ 0.3	+ 14.0	
Cedar .....	+ 2.0	+ 3.0	+ 32.3	
Hemlock .....	+ 1.5	+ 0.9	- 3.0	
Spruce .....	+ 0.8	+ 0.9	+ 3.6

Tea, coffee and cocoa .....	+ 4.1	+ 1.0	+ 3.0	
Vegetable oils .....	+ 2.0	- 0.5	+ 20.6	
Fruits, fresh .....	+ 1.9	- 6.9	+ 30.3	
Grains .....	+ 1.1	+ 0.1	- 6.1	
Potatoes .....	- 5.0	- 7.9	+ 4.8	
Livestock and poultry feeds .....	- 2.9	- 0.6	- 13.5	

(1) Change of 0.05 per cent or less.

#### Thirty Industrial Materials Price Index (1935-39=100)

The price index of Thirty Industrial Materials, calculated as an unweighted geometric average, advanced 0.2 per cent to 253.0 in March from the February index of 252.4. Prices were higher for six commodities, lower for seven and unchanged for seventeen. Principal changes included increases for raw rubber, raw wool, beef hides, raw cotton and wheat, and decreases for hogs, raw sugar, steers, linseed oil and bleached sulphite.

#### Canadian Farm Products Price Index (1935-39=100)

The price index of Canadian Farm Products at terminal markets declined 0.8 per cent to 249.0 in March from the February index of 250.9. A decrease of 0.8 per cent to 312.9 from 315.4 in the Animal Products index reflected lower prices for steers and hogs on both Eastern and Western markets and for calves in the West. Prices were higher for eggs and raw wool on both markets and for lambs and fluid milk in the East. The Field Products index moved down 0.7 per cent to 185.1 from 186.4 on lower prices for hay on both Eastern and Western markets, and for potatoes, corn and tobacco in the East. Prices were higher for rye and potatoes in the West.

#### Security Price Indexes (1956=100)

The Investors Index of common stock prices decreased 3.7 per cent to 157.7 from 163.8 between February and March. Indexes for all three major groups decreased. The downward trend was led by Finance down 5.0 per cent to 126.1 from 132.8, closely followed by Utilities down 4.9 per cent to 146.1 from 153.7, and by Industrials down 3.2 per cent to 167.2 from 172.8. In Finance, indexes for both sub-groups moved down as Investment and Loan declined 6.2 per cent to 116.3 from 124.0 and Banks decreased 4.4 per cent to 131.0 from 137.1. In Utilities, indexes for the five sub-groups decreased. Gas Distribution, registering the largest decrease, moved down 8.2 per cent to 336.5 from 366.6, followed by Pipelines down 6.3 per cent to 155.6 from 166.0. Telephone decreased 1.8 per cent to 101.9 from 103.8. Within Industrials, indexes for twelve sub-groups decreased and one increased. Decreases ranged from 14.7 per cent for Textiles and Clothing to 0.8 per cent for Beverages, the former to 130.4 from 152.8 and the latter to 235.5 from 237.4. Other decreases were made by Foods down 10.2 per cent, followed by Pulp and Paper down 9.5 per cent. Non-metallic Minerals and Primary Metals showed decreases of 6.7 per cent and 5.7 per cent respectively. Industrial Mines registered the only increase of 1.7 per cent to 203.1 from 199.8.

In the same period, the index of Mining stock prices eased 0.2 per cent to 109.6 from 109.8 as Base Metals showed a slight decrease of 0.5 per cent to 80.2 from 80.6. The index for Golds remained unchanged at 163.3.

Both supplementary price indexes decreased with Primary Oils and Gas down 9.7 per cent to 174.3 from 183.1 and Uraniums down 1.7 per cent to 239.4 from 243.5.

The Preferred stock index decreased 2.8 per cent to 76.9 from 79.1.

#### The Consumer Price Index (1949=100)

The Consumer Price Index for Canada rose by 0.3 per cent to 153.2 at the beginning of March from 152.7 at the beginning of February. The March 1968 index was 4.6 per cent above the level of 146.5 recorded twelve months earlier. Five of the seven main components rose by between 1.5 per cent and 0.4 per cent since the preceding month, however, these upward movements were partially offset by a decline of 0.7 per cent in the price of food. The increases were led by a 1.2 per cent rise in clothing prices and a rise of 1.5 per cent in the index for Tobacco and Alcohol, the latter being attributable to the imposition of higher taxes on cigarettes in Ontario and Saskatchewan. Similar tax increases on gasoline contributed to a 0.7 per cent increase in the Transportation index. The Health and Personal Care component remained unchanged from its level of the preceding month.

The Food index declined by 0.7 per cent to 148.7 in March from 149.8 in February, reflecting lower quotations for a number of fresh vegetable and meat items. Notably lower prices were recorded for potatoes, carrots, cabbage and lettuce. In contrast, most fresh fruits, including bananas, oranges and apples, registered upward price movements. Among meats, beef, fresh pork, and chicken prices were lower. Many staple items, including fresh milk, bread and sugar, remained unchanged in price, while butter, margarine and egg prices declined. The Food index in February 1968 was 3.8 per cent above its level of twelve months earlier.

The Housing index rose 0.4 per cent to 156.0 in March from 155.4 in February. Although rents edged up by only 0.2 per cent, home-ownership costs rose by 0.6 per cent partially as a result of higher property taxes and maintenance expenses. Household operation costs also rose, as the ending of mid-winter sales on furniture and household textiles resulted in higher prices for these items. The March 1968 Housing index was 5.1 per cent above its level of March 1967.

The Clothing index advanced by 1.2 per cent to 135.6 in March from 134.0 in February, reflecting general increases in virtually all clothing items priced. Men's wear prices moved up 1.9 per cent and women's wear prices advanced by 1.3 per cent, largely as a result of higher prices for most outerwear items. Lesser increases were recorded for children's wear, footwear, piece goods and clothing services. The Clothing index stood 3.7 per cent over its level of twelve months earlier.

The Transportation index rose by 0.7 per cent to 160.3 in March from 159.2 in the preceding month. Although new car prices remained unchanged, higher prices for repair parts and servicing were recorded generally. In Ontario and Saskatchewan, gasoline prices were about four per cent higher owing to increased provincial taxes, whereas automobile drivers in Alberta and Saskatchewan experienced a substantial rise in licensing fees. The Transportation index in March was 3.0 per cent above its level of twelve months previous.

The Health and Personal Care component in March remained unchanged from its February level of 194.3, which was 4.9 per cent above the corresponding March 1967 figure.

The Recreation and Reading component rose by 0.4 per cent to 172.5 in March from 171.8 in February chiefly as a result of higher television repair costs. This main component index stood 5.4 per cent over its level of twelve months earlier.

The Tobacco and Alcohol index advanced by 1.5 per cent to 138.4 in March from 136.4 in February. Higher taxes on cigarettes and tobacco in Ontario and Saskatchewan were chiefly responsible for this increase. The Tobacco and Alcohol index in March was at a level 8.5 per cent higher than its corresponding 1967 level.

Revised Highway Construction Price Indexes (1956=100)(1)

The Price Indexes of Highway Construction in Canada express prices paid by provincial governments in contracts awarded for highway construction each year as a percentage of prices paid in 1956. Base-weighted indexes are published annually and measure, through time, the effect of price change on the cost of specific programmes of highway construction in Canada represented by highway construction contracts of \$50,000 or more awarded by specified provincial governments over the period 1956 to 1966. Weights of items in the index, representing the relative importance of units of construction in the specified base-period are held constant. Only prices change from year to year, and the index thus measures the movement of prices through time. The all-items index or its components are useful for planning and budgeting for highway construction programmes, in escalating or up-dating previously costed road-work, in estimating replacement costs of previously completed roadwork, and as historical measurements of price trends in highway construction.

These indexes do not necessarily reflect the price movements of non-contract construction or maintenance work. The indexes are designed to measure price changes through time for a fixed programme of highway construction, in each of the seven provinces. Because price levels in the base-period varied from province to province the indexes cannot be used to compare price differences between provinces.

Prices contained in the index are not for units of labour and materials as is usually the case in construction price indexes but rather for units of construction work put in place such as an acre of clearing, a cubic yard of earth excavation or a ton of bituminous hot-mix paving. In addition, the index contains prices of some materials, such as culvert pipe, usually supplied to the contractor by the highway departments. Prices of highway construction work are annual weighted averages of bid prices of units of construction in groups of contracts awarded, (2) classified by price-determining characteristics of the contracts and the bid items such as volume of the bid item, type of contract and geographic location. Prices of material items of supply are prices paid by government departments to suppliers.

A complete description of the index is contained in the reference paper Price Indexes of Highway Construction in Canada, 1956=100, DBS Catalogue No. 62-520. A description of the revision is contained in December 1967 issue of Prices and Price Indexes, DBS Catalogue No. 62-002. Reprints of the article contained in this publication are available on request.

(1) The years refer to fiscal years. Thus 1966 refers to the period April 1, 1966 to March 31, 1967.

(2) There may be a considerable time lag between the letting of the contract and the completion of the job.

Explanation of Methods Used and Additional Sources for Price Series

Wholesale Price Indexes

Industry Selling Price Indexes (1956=100)

Industry Selling Price Indexes are published for most of the manufacturing industries and as such are the first Canadian "wholesale" price indexes to be organized according to an industry classification. Because of their common form of organization these indexes may be used in conjunction with a whole array of related statistics such as shipments, employment and inventories, to name a few, which also conform to the Standard Industrial Classification. Thus, Industry Selling Price Indexes have a clearly defined conceptual basis which fits into a common framework of analytical statistics. For this reason and because of their relatively high standard of representativeness they are recommended over their counterpart commodity series of the General Wholesale Index for purposes relating to output of manufacturing industries. However, because Industry Selling Price Indexes are available only since 1956 (in a few cases since 1949) the General Wholesale Index and its components must still be relied upon for earlier periods.

A complete description of these indexes is contained in: Industry Selling Price Indexes 1956-59, Catalogue No. 62-515

General Wholesale Index (1935-39=100)

The General Wholesale Index is a commodity classified index of prices. The index is "general" inasmuch as it incorporates a diverse selection of both primary and processed commodities. It is called "wholesale" because its ingredient prices relate to that broad and heterogeneous area of commodity distribution which excludes only retail trade. In fact, the term "wholesale" has more of a connotation of bulk trading than of any homogeneous level of distribution. Thus, though the index mainly includes prices of producers, it also covers transactions of "middle men" who trade in commodities of a type or in quantities characteristic of primary marketing functions.

Though general wholesale price indexes have been calculated by many countries for years there is no precise answer to the question of what such an index measures. This is so because the index cannot be associated with any adequately definable value aggregate. Unlike a consumer price index which can be identified with expenditures of household consumers, a general wholesale index covers a host of overlapping transactions sometimes involving the same ingredient in as many as three different stages of processing. Yet, conceptually, it is not a measure of the purchasing power of money because it omits significant areas of monetary transactions such as prices of land, labour, securities and services, except in so far as price of these things are implicit in commodity prices. As a conventional summary figure, its use has tended towards a reference level against which to observe the behaviour of particular price groups such as farm products, industrial materials, building materials and the various other groupings for which indexes are published. And as an indicator of general business conditions it is usually included in the group which is regarded as approximately coincident with the business cycle. However, its main attribute now lies in its long historical continuity.

For further details about the General Wholesale Index please consult: Wholesale Price Indexes 1913-50 (Reference Paper No. 24) Prices and Price Indexes 1949-52 (Vol. 23) (Catalogue No. 62-501)

Price Index Numbers of Commodities and Services Used by Farmers

The index of Commodities and Services used by Farmers is designed to measure the change in retail prices of farm operating costs and farm living costs. It is calculated thrice yearly, viz.: January, April and August, and is on the base 1935-39=100. For an explanation of method of construction and an historical record, please refer to "Price Index Numbers of Commodities and Services Used by Farmers, 1913 to 1948 (Revised 1948)." A special bulletin giving total and group index detail is released subsequent to each pricing date.

Canadian Farm Products Price Index (1935-39=100)

Wheat prices used in the index are buying prices of the Canadian Wheat Board for Nos. 1, 2 and 3 Manitoba Northern at Fort William - Port Arthur. Prices for western oats and barley are also supplied by the Wheat Board and quotations relating to No. 2 C.W., No. 3 C.W. and No. 1 Feed Oats and to Nos. 1 and 2 feed barley are included in the price index. Initial payments are first used in the index calculation and are revised as further payments are announced.

Final participation payments for the crop year August 1966 - July 1967 were announced on March 14, 1968 for oats and barley and on March 27, 1968 for wheat. Initial and final payments recently included in the index are shown in the following Table.

Unit	Final participation payments 1966-67 indexes revised August 1966 - July 1967		Initial payments 1966-67 included in index August 1966 - July 1967		Initial payments 1967-68 included in index August 1967

The Residential and Non-Residential Building Materials Price Indexes

The building materials indexes, shown in Tables 6 and 7 of this publication are constructed to measure price change of materials used in residential and non-residential building construction.

The residential building materials index in Table 6 is calculated on the base 1935-39 = 100, and using weights derived from the estimated material requirement for a national housing target for the year 1946, contains a total materials index for residential buildings, together with indexes for nine component groups. In Table 3 the total residential building materials index has been converted arithmetically to the base 1949=100 for easier comparison with other series.

The non-residential building materials index, which appears in Table 7, measures price change for materials used in non-residential building construction. This index is calculated on the base 1949 = 100 with weights derived from cost data provided by general and trade contractors for a sample of buildings constructed in Canada in the years 1948-1950.

Beginning in 1966 the sample of prices used to calculate the index has been revised while the weighting patterns and time bases have been left as described above. The new prices have been selected from the industry classified system of prices shown in Table 2 of this publication entitled "Industry Selling Price Index". For the latter indexes, prices collected are manufacturers' prices, f.o.b. plant with discounts to the largest class of customer removed; freight and taxes are excluded. Federal sales tax has been added to these prices where applicable.

For the residential building materials index, in addition to selecting new prices from the Industry Selling Price Indexes, the commodities included in 1966 have been revised following consultation with industry specialists, to produce a shorter but more efficient sample of commonly-used commodities. Greater regional coverage has been sought with a view to ultimately publishing as many regional commodity price indexes as possible. Also, a programme of experimental pricing is underway to determine the validity of using manufacturers' selling prices to represent price movement of wholesalers' and retailers' prices to contractors and other builders.

As well as updating the commodity coverage for the residential index, the new price sample has the advantage of measuring price change at a consistent level in the distribution process and is based on the wide range of commodity detail available in the Industry Selling Price Index. Also, the treatment of price discontinuities is handled in the same manner as described in the reference paper for the Industry Selling Price Index referred to below.

The new commodities introduced and the new price sample have been "linked" into the index at the level of the old price sample at the beginning of 1966 so that the movement of the index has not been affected by the changeover. The same component groups will continue to be published. The tables following show the items used and their percentage weights.

Explanations of the basic methods of construction and weighting patterns for the building materials indexes are contained in the following publications:

1. Price Index numbers of Residential Building Materials 1926-48, Catalogue 18-7080 - Price \$ .10.
2. Non-Residential Building Materials Price Index 1935-52, Catalogue 8002-524 - Price \$ .25.

A complete description of the characteristics of the Industry Selling Price Indexes and methods of sample selection will be found in: Industry Selling Price Indexes 1956-59 - Cat. 62-515.

Security Price Indexes

Security price indexes measure through time the effect of price change on the value of a portfolio of stocks bought and held by a hypothetical investor (as opposed to the more speculative trader). The portfolio represents stocks of Canadian companies listed on Toronto, Montreal and Canadian stock exchanges. The number of shares held for each issue is in proportion to the total number of shares outstanding. Prices in the common and mining stock indexes are Thursday's closing quotations as reported in the Globe and Mail and the Montreal Gazette. For preferred stocks, prices are monthly weighted averages of the daily closing prices in which weights are daily total sales. The price reference base for the indexes is the year 1956 which has been adopted as an interim base for recently developed DBS indexes. The indexes express current prices as a percentage of prices in 1956.

Revised indexes on the base 1956=100 were first presented in the June 1962 issue of this publication. The most important change in the revision of the index, apart from the shift in the price reference base, is the classification of stocks according to the Standard Industrial Classification. In the continuing major group Industrials 4 sub-groups (Milling and Grains, Food and Allied Products, Machinery and Equipment, and Building Materials) have been replaced by 8 new sub-groups (Foods, Printing and Publishing, Primary Metals, Metal Fabricating, Non-metallic Minerals, Chemicals, Construction, and Retail Trade). The remaining 5 sub-groups of the former index, viz., Industrial Mines, Beverages, Textiles and Clothing, Pulp and Paper, and Oils (renamed Petroleum) have been continued. The major group Utilities is continued but the Pipelines index has been added as a sub-group and the previous Power and Traction sub-group has been replaced by two new sub-groups, viz., Electric Power and Gas Distribution. A new major group Finance is composed of the former major group Banks and the former supplementary index Investment and Loan. Constant weights, which were previously limited to major groups, have been extended to sub-groups. Weights in the index continue to be based on shares outstanding.

For the list of stocks currently included in the Investors Index and Preferred Index, see Prices and Price Indexes for February 1966.

### Retail Price Indexes

#### Consumer Price Index

The Consumer Price Index was constructed to replace the Cost-of-Living Index and was first published October 23, 1932, on a time base 1949=100 and weights based on family expenditure patterns of 1947-48. A revision of the Consumer Price Index on the basis of 1957 expenditures while retaining the time base 1949=100, was released in an occasional paper on March 21, 1961 and the revised 1957-weighted index became the official measurement of price change forward from January 1961. The purpose of this latest revision was to bring the items included in the index, and their weights, into line with current family spending patterns.

The Consumer Price Index measures the percentage change through time in the cost of purchasing a constant "basket" of goods and services representing the purchases made by a particular population group in a specified time period. The basket is a constant or equivalent quantity and quality of goods and services but only items for which there is a continually measurable market price over time, corresponding to a specific quantity of the item, are included in the basket.

The index relates to a broad but specific group of urban families and reflects the price changes experienced by that "target group". The index is unlikely to represent closely the experience of any one family within the group nor should it be expected to reflect price change for other population groups for which income, family size and place of residence are characteristically different. The target group to which the current index relates is composed of families - (a) living in cities with over 30,000 population, (b) ranging in size from two adults to two adults with four children, and (c) with annual incomes during 1957 ranging from \$2,500 to \$7,000.

To measure the influences of price change on the cost of goods and services purchased by such families, the Consumer Price Index contains some 300 items.

Full details on the revised index are available in the occasional paper "The Consumer Price Index for Canada (1949=100) - Revision Based on 1957 Expenditures", DBS Catalogue Number 62-518.

Consumer Price Indexes for Regional Cities: Consumer Price Indexes are published monthly in this bulletin for the following cities or city combinations: St. John's, Halifax, Saint John, Montreal, Ottawa, Toronto, Winnipeg, Saskatoon-Regina, Edmonton-Calgary and Vancouver. With the exception of the index for St. John's, Newfoundland, which is constructed on the base June 1951=100, all indexes are on the base 1949=100. The regional indexes are patterned after the Consumer Price Index for Canada. They are similar to this index in terms of family coverage, item content and weighting system.

These indexes fulfil the same purpose as the cost-of-living series which they replace, viz.: each index is designed to measure the influence of changes in retail prices taking place in the localities specified, upon the cost of a fixed basket of goods and services representing the level of consumption of a representative group of families in those particular areas.

In using the city indexes, it should be remembered that they are not indicators of comparative levels of prices as between the cities. That is, they do not in any way indicate whether prices are higher or lower in one city than in another. This fact may be illustrated by reference to temperature changes occurring in two cities. Suppose that in city A the temperature increases by 20 per cent from Time 1 to Time 2, and that in city B it increases 30 per cent during the same interval. In this instance an index of temperature change for City A would be 120 at Time 2 when Time 1=100, and the corresponding index for city B would be 130. From these indexes, it is obviously impossible to say whether or not it is warmer or colder in city A or city B. While the indexes form valid measurements of temperature change, they do not in any way indicate the comparative levels of temperature.

Measuring the Purchasing Power of Earnings

Changing consumer price levels affect the amounts of goods and services which a dollar will buy, and average earnings, of course, will be affected in the same way. An earnings measurement which takes the change of consumer prices into account, can be calculated by reducing actual earnings averages by the percentage amounts consumer price levels rise, or increasing them by the amount price levels fall. The adjusted averages may be used to indicate the comparative quantities of goods and services which could be purchased by average earnings if consumer price levels and consumption patterns had remained constant. The following illustration shows how this kind of an adjustment can be made.

Suppose that a series of average weekly wages rises from \$80.00 in week A to \$100.00 in week B, and that in the same interval a consumer price index advances from 100.00 to 110.0. Because of the 10 per cent rise in consumer prices, \$1.00 will not buy as much in week B as it would in week A. Likewise, a 25 per cent rise from \$80.00 to \$100.00 will overstate the increase which has occurred in the purchasing power of average weekly wages. This overstatement can be removed by reducing the figure of \$100.00 by the amount of the consumer price increase. The adjusted average is \$90.91 ( $100.00/110.0 \times 100.0$ ), which may be referred to as a weekly wage average for week B expressed in the dollars of period A, or it may be said to indicate the level of real weekly wages relative to week A.

The foregoing calculation can be carried a step further to express in index number form the relationship between the week A average of \$80.00 and the week B figure of \$90.91. Taking the week A average of \$80.00 as equal to 100.0, the week B index becomes 113.6 ( $90.91/80.00 \times 100.0$ ). Such an index may be called an index of weekly real wages. It indicates that average wages for week B will buy 13.6 per cent more goods and services than those received in week A, in spite of a 10 per cent rise in consumer prices. This 13.6 per cent increase in real wages compares with the rise of 25 per cent in money wages ( $100.00/80.00 \times 100.0$ ).

It should be noted that while the estimates of average real wages may reflect the experiences of broad groups of workers fairly well, their applicability to individual wage-earners depends upon a number of considerations. For example, individual earnings will differ significantly from the group average, depending upon occupation, industry, geographical location, or sex of the wage-earner. Moreover, individual spending habits differ widely, but the consumer price index which is used to adjust the earnings data refers only to the average consumption pattern of a particular income group. Group-spending patterns change over periods of time. To the extent that this occurs, the earnings data adjusted by the consumer price index (which has a "fixed" consumption pattern), will gradually be rendered less valid. Finally, some part of income may be saved, and it should be borne in mind that it is not appropriate to reduce savings to a constant dollar basis by using index which reflects consumption patterns.

It should also be kept in mind that measures of change in real earnings calculated from averages of gross earnings may differ from changes in the purchasing power of "take-home" pay, due to such factors as changes in personal income tax, pay deductions for such things as social insurance and pension plans. Thus index numbers of real wages should not be interpreted as measuring fluctuations in the levels of consumption of wage-earners or wage-earners' families; they are intended to show only the trend in purchasing power of wages over the items covered by the price index, and in addition to the factors already mentioned, do not take into account other family income (including family allowances) or changes in the savings position of families.

The table in this report showing indexes of both actual and real wages uses 1961 as a reference year. However, the adjustment made in the foregoing illustration can be applied to any reference level; percentage change between any two periods will be the same regardless of the reference period selected.

Spatial Retail Food Price Indexes for Selected Canadian Cities

1958-67

For some years the Dominion Bureau of Statistics has been investigating the problems of calculating indexes which will indicate, with some precision, the extent of the differences in the average level of retail prices between major Canadian cities. In commodities and services other than food, problems of comparability of items are of major significance and it has not yet been possible to cover these areas of family budgets.

In foods, however, the problem of comparability of items between cities is at a minimum, and it has been possible to calculate indexes which are considered to indicate the extent of the difference in the average level of retail food prices between Winnipeg and 10 other major Canadian cities with sufficient reliability. These have been calculated annually for 1958-67, and will be maintained on an annual basis in the future.

These indexes have been calculated on the basis of prices collected in each of the eleven cities weighted in accordance with average urban food expenditures as contained in the weighting diagram of the Canada Consumer Price Index. Because of the differences in food purchases between cities it is impossible to calculate entirely accurate measurements. The closest approximation would be derived, for example, from the use of both Winnipeg and Vancouver weights in the calculation of the Winnipeg-Vancouver comparison, rather than the use of average urban food expenditures. However, the calculation of a number of indexes using weights relating to each city did not produce indexes significantly different from those which appear in Table 13 on page 33. This reflects the fact that while differences in food purchases exist, the magnitude of the differences in the cities covered is not such as to affect spatial comparisons significantly.

In addition to the problem of weights, the difficulty of obtaining prices for identically the same description of each food item in each city is of some consequence. While considerable care is taken to minimize differences due to variations in quality of the items priced, it is impossible to completely eliminate all such variations. This is particularly true in the case of beef items, where variations in consumption by grades as between cities undoubtedly affect the resultant price comparisons.

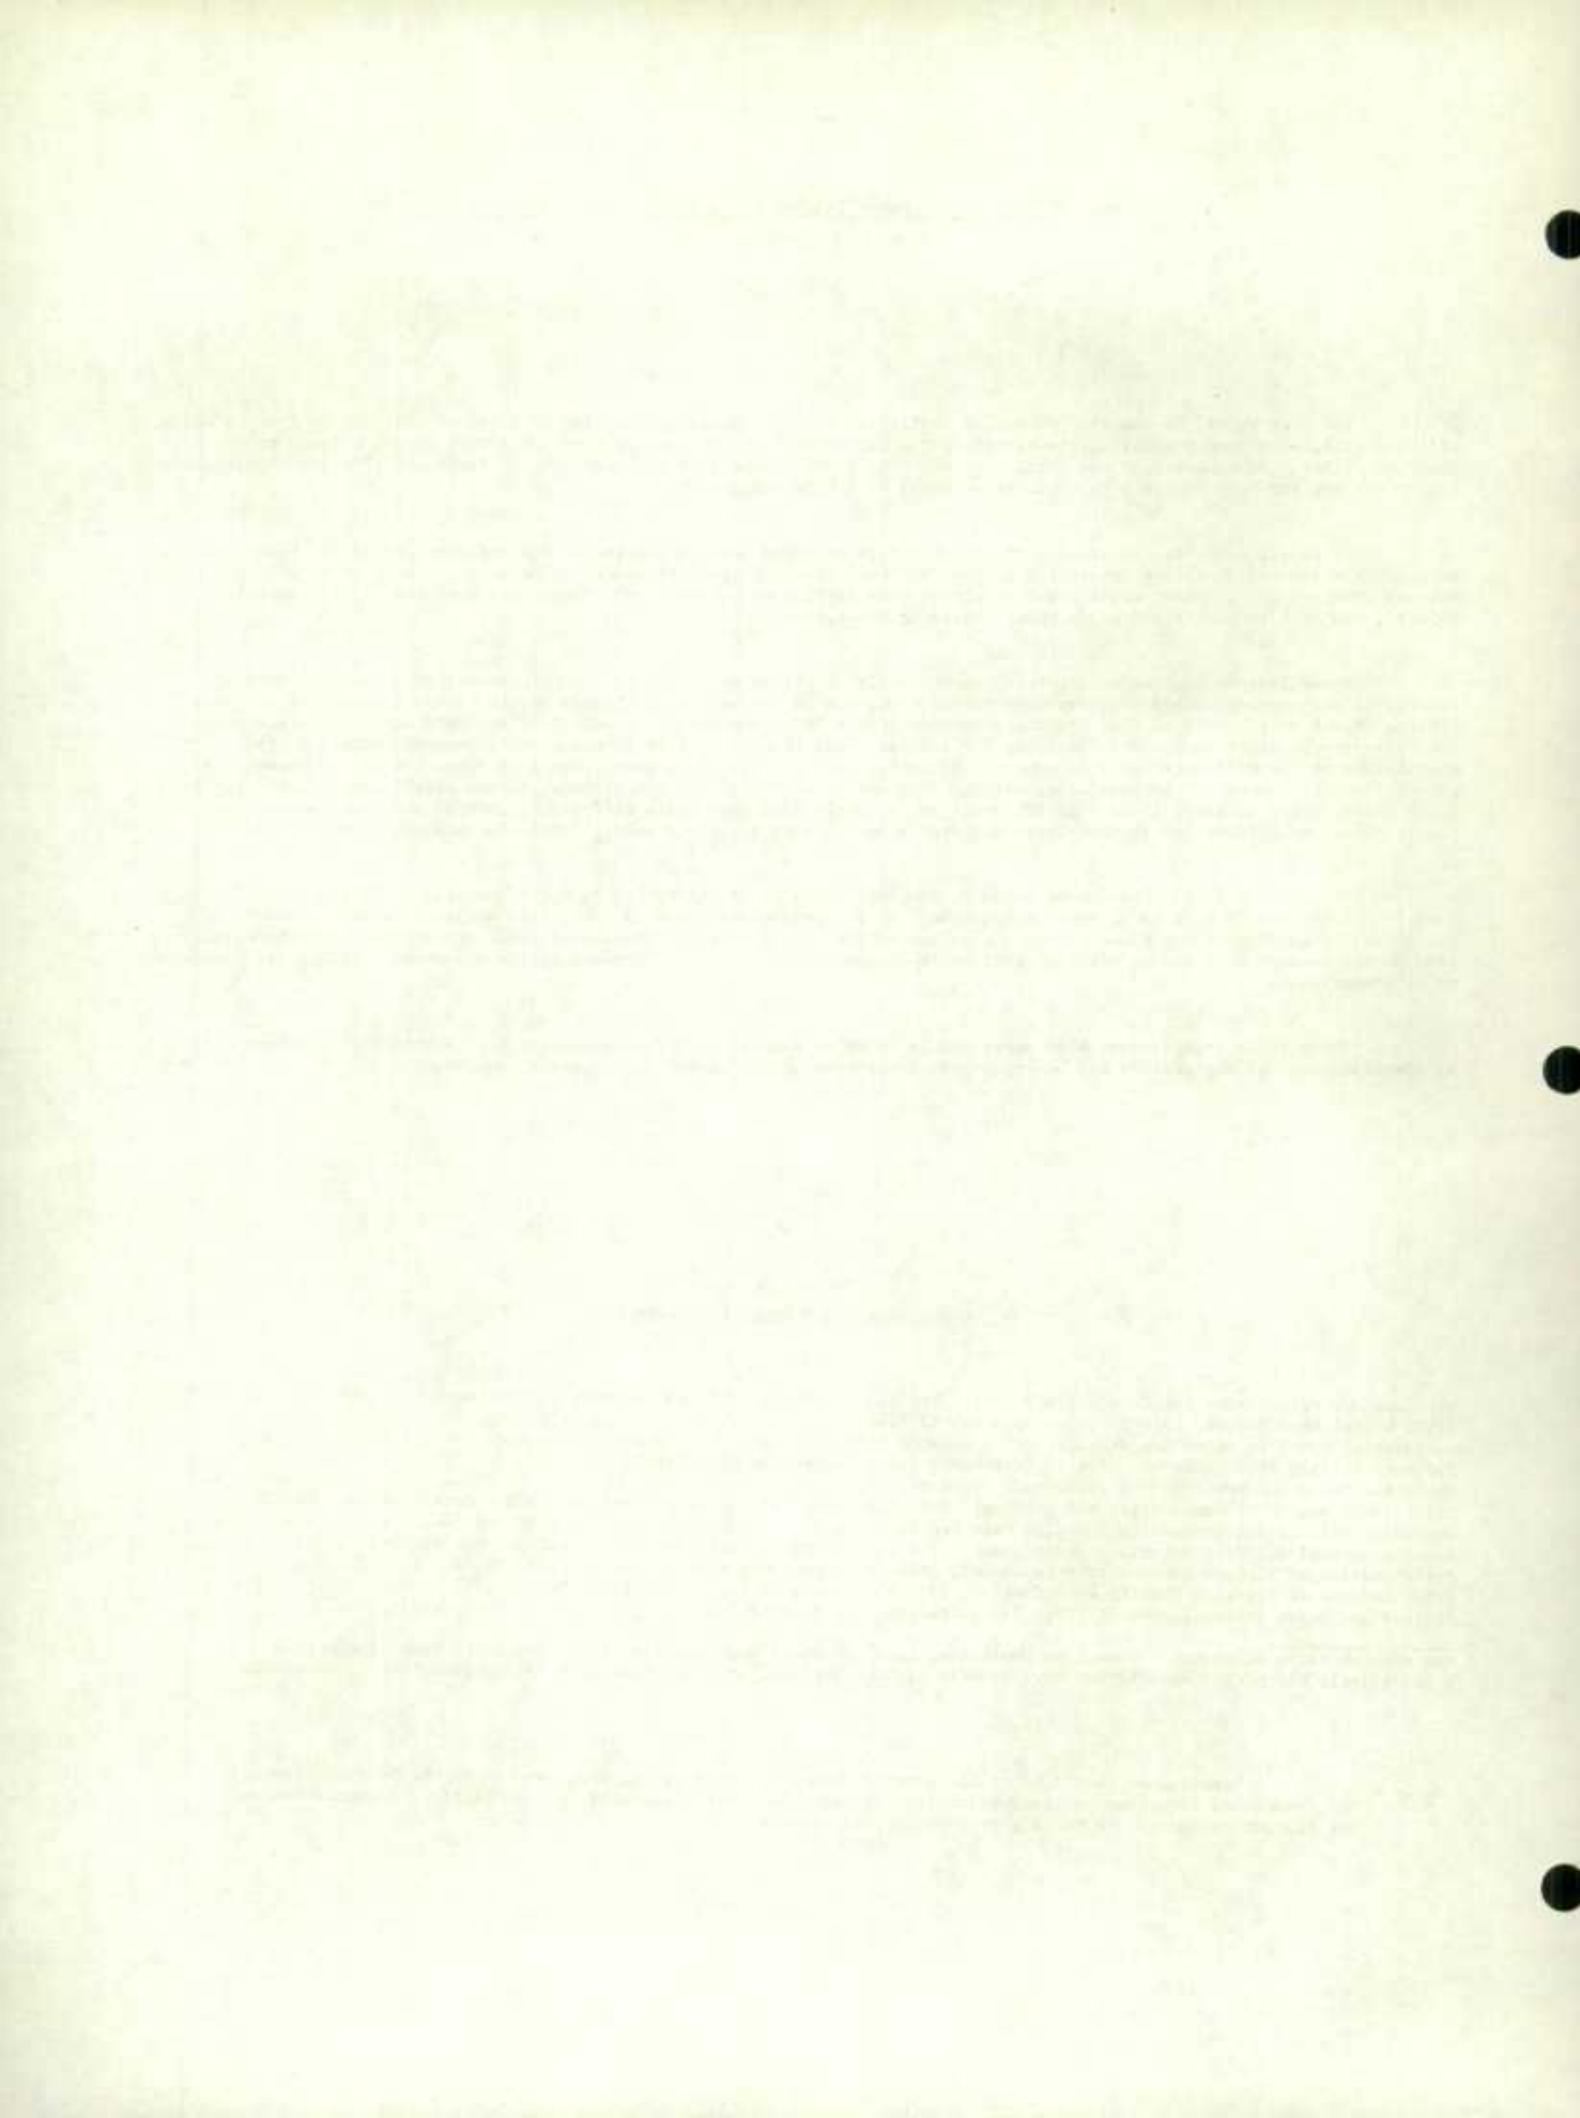

While these indexes have been expressed in terms of Winnipeg = 100, the selection of Winnipeg as the base city has no significance, and the indexes may be expressed on the base of any of the eleven cities included.
