NOTES ON PRICES AND PRICE INDEX NUMBERS

Industry Selling Price Indexes (1961=100)

In 31 manufacturing industries, Industry Selling Price Indexes were higher in July than in June. Industries showing decreases numbered 30, while 38 remained the same.

In each of the past three months the most significant price changes have been those recorded in the primary metals group of industries, in particular the smelting and refining industry the index for which now stands at 152.2 compared with 165.0 in April 1970. This decline is a result of lower export prices for copper. Elsewhere increases in the foods and beverages and paper and allied products groups were offset by decreases in the indexes for textiles and wood products groups. Within the foods and beverages group a continuing decline in the index for slaughtering and meat packing was outweighed by higher levels for fish products, fruit and vegetable canners and preservers and miscellaneous food products industries.

The arithmetic average of the 99 industry indexes moved down slightly in July to 119.7 from the June average of 119.8. The average increase for those industries showing price rise was 0.5%, while the comparable figure for those showing declines was 0.5%.

June to July Changes in Industry Indexes

General Wholesale Index (1935-39 = 100)

The General Wholesale Index moved down 0.1% in July to 286.7 from the revised June index of 287.0 and was 1.4% higher than the July 1969 index of 282.7. Seven of the eight major group indexes were lower, while one advanced.

The non-ferrous metals products group index declined 1.1% in July to 277.9 from 281.0 in response to lower prices for refined copper (export sales) and lead. The animal products group index eased down 0.5% to 323.9 from 325.5 reflecting price decreases for livestock and fresh meats. Decreases of 0.2% or less occurred in five major group indexes, textile products to 256.9 from 257.3, chemical products to 224.9 from 225.3, iron products to 306.0 from 306.2, wood and paper products to 383.1 from 383.3 and non-metallic minerals to 214.4 from 214.5.

A rise of 0.7% to 238.8 from 237.2 in the vegetable products group index reflected price increases for potatoes, tea, coffee, cocoa and fresh fruits.

The following table shows some of the more noteworthy changes:

Commodity group and sub-group	Percentage changes

#### Thirty Industrial Materials Price Index (1935-39=100)

The price index of Thirty Industrial Materials, calculated as an unweighted geometric average, declined 0.4 per cent to 270.4 in July from the June index of 271.5. Prices were lower for twelve commodities, higher for four and unchanged for fourteen. Principal changes included decreases for raw rubber, steel scrap, tin, beef hides, domestic lead and sisal, while increases were recorded for unbleached sulphite pulp, bleached sulphite pulp, linseed oil and raw wool.

#### Canadian Farm Products Price Index (1935-39=100)

The price index of Canadian Farm Products at terminal markets advanced 0.2 per cent to 275.0 in July from the June index of 274.4. An increase of 2.7 per cent to 201.3 from 196.1 in the Field Products index reflected higher prices for potatoes on both Eastern and Western markets, for hay and barley in the East and for flax in the West. Lower prices were shown for oats and wheat in the East and for rye in the West. The Animal Products index declined 1.1 per cent to 348.8 from 352.6 on lower prices for calves, lambs and hogs on both markets, for raw wool and poultry in the East and for butterfat in the West. Higher prices were shown for eggs on both Eastern and Western markets, and for raw wool and veers in the West.

### The Consumer Price Index (1961=100)

The Consumer Price Index for Canada rose by 0.5 per cent to 130.5 in July from 129.9 in June. The latest increase was marginally lower than the average June to July rise recorded in the past five years and left the index 3.2 per cent above its level of twelve months previous. This slower rate of increase compared to twelve-month periods ending in the earlier part of the year is largely attributable to a deceleration in the advance of the Food and Clothing indexes, although other major components also registered slower rates of increase in recent months. Between June and July the major contributor to the rise was the Housing and Food components which rose by 0.6 and 0.5 per cent respectively. The less important Recreation and Reading index advanced by 1.6 per cent largely as a result of higher newspaper prices. The Transportation index edged up by 0.1 per cent, while the remaining major components were unchanged from the preceding month.

The Food index rose by 0.5 per cent to 131.6 in July from 130.9 in June. The movement in the latest month marked the fifth consecutive month in which the level of food prices registered smaller increases than in the corresponding month a year earlier. Between January and July 1970 the Food index moved up by only 1.2 per cent, whereas in the same six-month period last year it advanced by 3.0 per cent. Since July 1969, the Food index increased 2.2 per cent, which compares with an average rise of 3.8 per cent in the previous five July-to-July periods. In the last twelve months the price level of food for home consumption moved up by 1.7 per cent, while restaurant meal prices, reflecting a higher service content, advanced by 5.7 per cent. Between June and July, about two-fifths of the rise in the Food index was attributable to a 1.4 per cent advance in the price of restaurant meals. Food at home, by contrast, recorded an average price increase of 0.4 per cent with mixed movements of component items. Among staples which registered price increases, bread rose 1.4 per cent mainly reflecting higher prices in Toronto, while butter and margarine increased 0.3 and 0.7 per cent, respectively. Fresh milk prices were unchanged, while sugar prices declined by 0.6 per cent to register the first decrease in several months. Ground coffee prices continued to increase, advancing 2.9 per cent in the latest month and 18.7 per cent since a year earlier. Instant coffee also advanced in price by 2.2 per cent since June to stand 6.4 per cent above its level of twelve months previous. Among meat items, beef and pork prices registered declines of 0.2 and 1.7 per cent, respectively, in the latest month to levels somewhat below those of a year earlier. Poultry prices declined by 1.7 per cent since June and stood 2.7 per cent below their level of twelve months previous. Egg prices also declined, for the seventh consecutive month, to a level thirty per cent below their peak of December 1969. Among produce items, fresh fruit prices were generally higher, while fresh vegetables registered a mixture of advances and declines. Oranges, apples and grapefruits increased in price in the latest month, while bananas registered an eleven per cent decline in response to numerous specials. Grapefruit prices have risen markedly in the last five months and in July were over forty per cent higher than a year earlier. Fresh vegetable prices were mixed with lettuce, potatoes and tomatoes registering increases while celery, cabbage, onions and turnips were lower.

The Housing index rose 0.6 per cent to 131.5 in July from 130.7 in June, exceeding somewhat the rate of increase in this component between these two months in recent years. Higher mortgage interest rates were the major cause of a 0.7 per cent rise in the shelter index, with rents and the cost of new houses increasing fractionally. Among household operation items, a rise in electricity rates in a number of Ontario cities advanced this component by 1.3 per cent from the preceding month to a level over eleven per cent higher than a year earlier. Some increases were also recorded in the prices of household textiles, dishes, lightbulbs and a number of cleaning supplies since the preceding month. On the other hand, price declines occurred for floor coverings, garbage cans and lawnmowers. Higher wage rates for household help in Regina and Ottawa were partially offset by lower ones in Saint John, New Brunswick. Since July 1969 the price level for shelter and for household operation rose by 6.3 per cent and 2.6 per cent, respectively, to advance the total Housing index by 5.0 per cent over the twelve-month period.

The Clothing index at 126.9 in July was unchanged from its June level. While prices of women's wear and footwear rose fractionally since the preceding month these advances were offset by a decline in men's wear prices, particularly for men's shirts, slacks and windbreakers, as well as for children's wear, and for piece goods. The latest Clothing index was 1.7 per cent above its July 1969 level.

The Transportation index went up by 0.1 per cent to 125.2 in July from a level of 125.1 a month earlier, largely as a result of a seasonal increase in train fares. Marginally lower new car prices in most cities reduced the automobile operation component by 0.1 per cent although there was evidence of scattered increases in the price of motor oil. Gasoline prices, on average, were unchanged for the fourth consecutive month. Over the year since July 1969 the Transportation index increased by 3.7 per cent which was the average such rise in the past five years.

The Health and Personal Care index was unchanged in July from its level of 139.8 in June, which was 4.2 per cent higher than in July of last year.

The Recreation and Reading index rose 1.6 per cent to 132.4 in July from 130.3 in June largely as a result of higher newspaper subscription rates which, advancing for the third consecutive month, pushed the reading component up to a level more than ten per cent above that of twelve months earlier. The Recreation and Reading index as a whole increased by 3.9 per cent over the past twelve months.

The Tobacco and Alcohol component did not change in July from its level of 126.5 in June. Its advance of only 0.2 per cent from July 1969 is the lowest for any previous consecutive twelve-month period since October 1963.

Security Price Indexes (1956=100)

The Investors Index of common stock prices continued a downward movement begun in March, easing 0.6 per cent between June and July to 166.4 from 167.4. The three major groups moved in varying directions; Industrials decreased 0.7 per cent, Utilities rose 1.6 per cent, and Finance dropped 2.7 per cent. Within Industrials, indexes for four sub-groups increased and nine decreased. Textiles and Clothing registered the largest increase at 9.3 per cent, followed by Non-metallic Minerals up 2.6 per cent, Petroleum up 1.0 per cent, and Beverages up just 0.6 per cent over last month. Decreases ranged from 4.3 per cent for Retail Trade to 0.2 per cent for Construction. Chemicals dropped 3.2 per cent to an all-time monthly low of 64.5. Industrial Mines, Foods, and Primary Metals all showed losses of under one per cent. In Utilities, the only loss was shown by Transportation down 4.5 per cent to 167.1, its lowest monthly point since 1968. Electric Power remained unchanged at 113.0. Pipelines, showing the largest increase, moved up 5.9 per cent to 173.7. In Finance, both Banks and Investment and Loan decreased, the former by 2.8 per cent and the latter by 2.4 per cent.

In the same period, the index of Mining stock prices remained unchanged at 99.0 as Golds rose 2.2 per cent to 104.4 and Base Metals dropped 1.2 per cent to 96.0.

Of the two supplementary price indexes, Uraniums and Primary Oils and Gas rose 1.0 per cent and 2.4 per cent respectively.

The Preferred stock index eased 0.6 per cent to 62.3 from 62.7.

(1) Consists of General Wholesale Index less Animal products and Vegetable products component groups (see preceding page). (2) Consists of Iron products, and Non-ferrous metals products component groups less gold (see preceding page). (3) These two series comprise the General Wholesale Index. (4) Excludes golds. (5) Indexes for 1970 are subject to revision.

TABLE 3. Selected Price Indicators - Concluded

1969 .....							

(1) Major components for the provincial indexes were presented in the August 1969 issue of Prices and Price Indexes. (2) The years referred to are fiscal years. For example, 1956 represents the period April 1, 1956 to March 31, 1957. (3) Direct comparisons should not be made between this index and the highway index published by the Ontario Department of Highways. The item content of the two indexes is substantially different. \* To assist comparison with other published series the indexes presented below have been arithmetically converted from 1956=100 to 1961=100. The 1956=100 indexes are available on request.

(5) Materials weighted 65.0, wage rates 35.0.

(6 & 7) National Income and Expenditure Accounts, Catalogue 13-001, quarterly.

(7) This series contains an engineering component as well as a building component, and is therefore not precisely comparable in coverage with the non-residential composite index. The implicit price indexes are adjusted for changes in contractors profit and productivity.

\* For further detailed explanation see Prices and Price Indexes - May 1970.

Explanation of Methods Used and Additional Sources for Price Series

Industrial Price Indexes

Industry Selling Price Indexes (1961=100)

Industry selling price indexes are published for approximately 100 industries within manufacturing. Also published are approximately 425 commodity price indexes for the products of these industries. The Classification system is that of the 1960 standard industrial classification, thus permitting the joint use of price statistics with other data such as production and employment similarly classified.

The data upon which both the initial selection of commodities to be priced and responding firms are made are contained in the Census of Manufacturers, a series of annual surveys collecting statistics on shipments of commodities, employment and materials used. Prices are collected on the 15<sup>th</sup> of each month or the nearest transaction date for the commodity being priced; sales and excise taxes are excluded.

The industry classified price indexes are useful for analysis of price movements, for estimation of the constant dollar value of shipments, and for purposes of contract escalations.

A complete description of these indexes is contained in: Industry Selling Price Indexes 1956-68, Catalogue No. 62-528.

General Wholesale Index (1935-39=100)

The General Wholesale Index is a commodity classified index of prices. The index is "general" inasmuch as it incorporates a diverse selection of both primary and processed commodities. It is called "wholesale" because its ingredient prices relate to that broad and heterogeneous area of commodity distribution which excludes only retail trade. In fact, the term "wholesale" has more of a connotation of bulk trading than of any homogeneous level of distribution. Thus, though the index mainly includes prices of producers, it also covers transactions of "middle men" who trade in commodities of a type or in quantities characteristic of primary marketing functions.

Though general wholesale price indexes have been calculated by many countries for years there is no precise answer to the question of what such an index measures. This is so because the index cannot be associated with any adequately definable value aggregate. Unlike a consumer price index which can be identified with expenditures of household consumers, a general wholesale index covers a host of overlapping transactions sometimes involving the same ingredient in as many as three different stages of processing. Yet, conceptually, it is not a measure of the purchasing power of money because it omits significant areas of monetary transactions such as prices of land, labour, securities and services, except in so far as prices of these things are implicit in commodity prices. As a conventional summary figure, its use has tended towards a reference level against which to observe the behaviour of particular price groups such as farm products, industrial materials, building materials and the various other groupings for which indexes are published. And as an indicator of general business conditions it is usually included in the group which is regarded as approximately coincident with the business cycle. However, its main attribute now lies in its long historical continuity.

For further details about the General Wholesale Index please consult: Wholesale Price Indexes 1913-50 (Reference Paper No. 24) Prices and Price Indexes 1949-52 (Vol. 23) (Catalogue No. 62-501)

Price Index Numbers of Commodities and Services Used by Farmers

The index of Commodities and Services used by Farmers is designed to measure the change in retail prices of farm operating costs and farm living costs. It is calculated thrice yearly, viz.: January, April and August, and is on the base 1935-39=100. For an explanation of method of construction and an historical record, please refer to "Price Index Numbers of Commodities and Services Used by Farmers, 1913 to 1948 (Revised 1948)." A special bulletin giving total and group index detail is released subsequent to each pricing date.

Canadian Farm Products Price Index (1935-39=100)

Wheat prices used in the index are buying prices of the Canadian Wheat Board for Nos. 1, 2 and 3 Manitoba Northern at Thunder Bay. Prices for western oats and barley are also supplied by the Wheat Board and quotations relating to No. 2 C.W., No. 3 C.W. and No. 1 Feed Oats and to Nos. 1 and 2 feed barley are included in the price index. Initial payments are first used in the index calculation and are revised as further payments are announced.

No final payments for the crop year August 1968 - July 1969 were announced on March 5, 1970, for wheat, oats and barley.

Unit	Initial and total participation payments 1968-69 and 1969-70			
	August 1968 - July 1969		August 1969 - July 1970	
	Initial payment(1)	Total participation payment(2)	Initial payment(3)	Total participation payment(4)
dollars

(1) Used in original indexes from August 1968 to July 1969. (2) No final payments for crop year August 1968 to July 1969.

(3) Used in indexes August 1968 to present. (4) Not yet announced by Wheat Board.

### Residential and Non-Residential Building Construction Price Indexes

The fixed-weighted input price indexes of materials and wage rates for residential and non-residential building construction are being published here for the convenience of users (Table 20). A more complete description of the characteristics of the indexes appeared in the May 1970 issue of Prices and Price Indexes, and this explanation is available on request from the Prices Division, as is historical monthly data for the series.

Because the indexes measure the impact of price change on the materials and labour inputs to construction, and not the effects of changes in profit margins or productivity, there is thought to be an upward bias in these indexes as indicators of price change for the output of building construction, or buildings in place. Users are therefore warned to exercise caution in making use of the series, for this purpose. A comparison of these series with the implicit price deflators(1) providing an estimate of price change for the output of the industry), derived from the measurement of gross fixed capital formation in constant dollars, will provide some insight into the effects on the price movement of adjusting the fixed-weighted input indexes for changes in productivity and profit margins.

During the period from 1926-1966 a special sample of respondents supplied materials prices for the index. As of 1961 this sample has been replaced with prices from the ISPI system(2). The latter are published monthly in Table 2 of this publication.

The Construction wage rate series is based on wage rate material supplied by the Labour Standards Branch, Dept. of Labour, and relates to minimum wages paid on government contracts for construction in a variety of trades and cities.

Users are reminded that the indexes were arithmetically rebased to the year 1961=100 and therefore combining the components with the weights as shown will not provide the composite index provided. Users able to provide their own weights for the components can recombine the components to suit their particular needs.

### Security Price Indexes

Security price indexes measure through time the effect of price change on the value of a portfolio of stocks bought and held by a hypothetical investor (as opposed to the more speculative trader). The portfolio represents stocks of Canadian companies listed on Toronto, Montreal and Canadian stock exchanges. The number of shares held for each issue is in proportion to the total number of shares outstanding. Prices in the common and mining stock indexes are Thursday's closing quotations as reported in the Globe and Mail and the Montreal Gazette. For preferred stocks, prices are monthly weighted averages of the daily closing prices in which weights are daily total sales. The price reference base for the indexes is the year 1956 which has been adopted as an interim base for recently developed DBS indexes. The indexes express prices as a percentage of prices in 1956.

Revised indexes on the base 1956=100 were first presented in the June 1962 issue of this publication. The most important change in the revision of the index, apart from the shift in the price reference base, is the classification of stocks according to the Standard Industrial Classification. In the continuing major group Industrials 4 sub-groups (Milling and Grains, Food and Allied Products, Machinery and Equipment, and Building Materials) have been replaced by 8 new sub-groups (Foods, Printing and Publishing, Primary Metals, Metal Fabricating, Non-Metallic Minerals, Chemicals, Construction and Retail Trade). The remaining 5 sub-groups of the former index, viz., Industrial Mines, Beverages, Textile and Clothing, Pulp and Paper, and Oils (renamed Petroleum) have been continued. The major group Utilities is continued but the Pipelines index has been added as a sub-group and the previous Power and Traction sub-group has been replaced by two new sub-groups, viz., Electric Power and Gas Distribution. A new major group Finance is composed of the former major group Banks and the former supplementary index Investment and Loan. Constant weights, which were previously limited to major groups, have been extended to sub-groups. Weights in the index continue to be based on shares outstanding.

For the list of stocks currently included in the Investors Index and Preferred Index, see Prices and Price Indexes for February 1970. In the Industrial sub-group Non-metallic Minerals, Canada Cement Co. Ltd. changed its name to Canada Cement Lafarge Ltd. effective May 27, 1970.

In July, Silverwood Dairies Ltd. "A" changed its name to Silverwood Industries Ltd. and Triad Oil Co. Ltd. changed its name to B.P. Oil and Gas Ltd. James United Industries Ltd. was replaced by Galt Malleable Iron Ltd.

#### Highway Construction Price Indexes (1961=100) (1)

The Price Indexes of Highway Construction in Canada express prices paid by provincial governments in contracts awarded for highway construction each year, as a percentage of prices paid in 1961. The arithmetic conversion of the indexes to a 1961 time base does not change their percentage movements as compared to the previously published indexes to a 1956=100 time base. Users are warned that an aggregation of the converted major group indexes with the published weights will not yield the published 1961=100 all items indexes. The conversion does not create this problem for a user wishing to reweight the converted major group indexes using weights appropriate to his own purpose.

(1) The years refer to fiscal years. Thus 1968 refers to the period April 1, 1968 to March 31, 1969.

Base-weighted indexes are published annually and measure, for the period 1956 to 1968, the effect of price change on the cost of specific programmes of highway construction in Canada represented by highway construction contracts of approximately \$50,000 or more awarded by specified provincial governments during the weight-base period. Weights of items in the index, representing the relative importance of units of construction in the year 1956 are held constant. Only the estimates of prices change from year to year, and the indexes thus measure the movement of prices through time. For a more complete statement of the problems of estimating price change for highway construction see pages vi & vii of the December 1967 issue of Prices and Price Indexes, DBS publication 62-002 and pages 9 & 10 of the reference paper Price Indexes of Highway Construction in Canada DBS publication 62-520. The all-items index or its components are useful for planning and budgeting for highway construction programmes, in escalating or up-dating previously costed roadwork, in estimating replacement cost of previously completed roadwork, and as historical measurements of price trends in highway construction.

The indexes do not necessarily reflect the price movements of non-contract construction or maintenance work. The indexes are designed to measure price changes for a fixed programme of highway construction, in each of the seven provinces. Because price levels in the time base-period (1961) varied from province to province the indexes cannot be used to compare price differences between provinces, but only to compare differences in the rate at which prices are changing in the provinces.

Prices contained in the index are not for units of labour and materials as is usually the case in construction price indexes but rather for units of construction work put in place such as an acre of clearing, a cubic yard of earth excavation or a ton of bituminous hot-mix paving. In addition, the index contains prices of some materials, such as culvert pipe, usually supplied to the contractor by the highway departments. Prices of highway construction work are annual weighted averages of bid prices of units of construction in groups of contracts awarded, classified by price-determining characteristics of the contracts and the bid items such as volume of the bid item, type of contract and geographic location. Prices of material items of supply are prices paid by government departments to suppliers.

#### Price Indexes of Electric Utility Construction

In electric utility terms, the index is designed to provide an estimate of the impact of price change on the cost of materials, labour and equipment used in constructing and equipping electric utilities in a specified base period. The index provides an estimate of how much more, or less it would cost to reproduce the base-period programme of construction in another period, using the same construction technology as in the base period and assuming rates of profit and productivity in construction are the same in both periods.

As the market does not yield comparable selling prices for such unique transactions as, for example, the sale of a transmission line, it was not possible to produce an index of the prices of completed structures. Completed structure indexes would be appropriate for users wishing either to estimate reproduction costs or to deflate capital formation. For such uses the indexes introduced in this publication have specific shortcomings. Nonetheless, they may be helpful for such purposes provided the users understand the deficiencies. Thus the reader is asked to make particular note of Section III, of DBS Occasional Paper 62-526 Capital Expenditures Price Indexes - The Necessity for Compromise and Section XI, (of the same paper) Uses and Limitations. In addition, because particular construction projects are unique, the aggregate indexes will not likely be appropriate to specific projects since they relate to an average mix of materials, labour and equipment derived from a variety of projects in a specific base period. Thus, if the component price indexes and their weights included in the aggregate index presented herein are inappropriate for a particular purpose the user should consider selecting appropriate component indexes from among those published herein. These indexes could then be combined into an aggregate index by utilizing weights derived from the projects or assets to be costed or deflated.

Prices used in the indexes are for the most part selling prices reported monthly by manufacturers for materials or equipment. The price reported is for units and terms of sale representative of the volume sales of the manufacturer. Where sales to electric utilities form a small share of the total sales of the manufacturer, the price reported may not adequately represent the price to the construction trade and others directly involved in constructing and equipping electric utility facilities. In such cases, prices charged other manufacturers or wholesalers have been included in the index. Federal sales tax changes are reflected in the index but no adjustments have been made for provincial tax changes. Until December 1964 wage rate data were supplied by the Federal Department of Labour and represented minimum hourly rates paid to construction workers in major cities employed on federal government contracts. In 1965 union basic wage rates reported by major utilities and some contractors were incorporated into the index. The sample selected provides an estimate of wage rate change for urban own account and contract electric utility construction. Some further improvements will be made to improve the coverage relating to rural non-union work for transmission lines.

Construction has been defined as new construction or major reconstruction for distribution systems, transmission lines and transformation or switching stations. Maintenance and operating costs are excluded. Cost data were supplied by major utilities, relating to own account and to contract construction erected during the last half of the 1950's. Weights were derived from these data which indicated the relative importance of the major inputs to the construction. The components of cost relating to distribution and transmission facilities encompass such items as poles, hardware, conductors, insulators, meters, distribution transformers and expenditures for labour, e.g. - linemen and groundmen. Costs relating to construction equipment such as trucks, and components of equipment operating costs such as tires, gasoline and repairs were also included. Transformation and switching stations encompass some of the items listed above but the most important elements of cost relate to transformers and switching equipment. Expenditures for land and rights-of-way have been excluded.

The term Canadian electric utility has been defined to include municipal as well as non-municipal utilities but the majority of the cost data tabulated was derived from the major nonmunicipal utilities. Manufacturers who produce electricity for their own use and who may also sell electricity have been excluded from the cost survey.

#### Retail Price Indexes

##### Consumer Price Index for Canada (1961=100)

The Consumer Price Index measures the percentage change through time in the cost of purchasing a constant "basket" of goods and services representing the purchases by a particular population group in a specified time period. The "basket" is an unchanging or equivalent quantity and quality of goods and services of items for which there is a continually measurable market price over time, corresponding to a specific quantity of the item.

The index relates to a broad but specific group of urban families and reflects the price changes experienced by that "target group". The index is unlikely to represent closely the experience of any one family within the group nor should it be expected to reflect price change for other population groups for which income, family size and place of residence are characteristically different. The target group to which the current index relates is composed of families - (a) living in cities with over 30,000 population, (b) ranging in size from two adults to two adults with four children, and (c) with annual incomes during 1957 ranging from \$2,500 to \$7,000. To measure the influences of price change on the cost of goods and services purchased by such families, the Consumer Price Index reflects movements of some 300 items.

The history of consumer price indexes in Canada extends back to the early 1900's and encompasses periodic revisions of index base reference periods and weighting patterns. In 1952, the time base was updated to 1949=100 from 1935-39=100 and, at the same time, weights were revised to reflect family expenditure patterns in 1947-48. A subsequent revision of weights based on 1957 expenditures was introduced at the beginning of 1961 and the time base was revised from 1949=100 to 1961=100 at the beginning of 1969.

Full details on the latest weighting patterns and time base revisions are available in the occasional paper "The Consumer Price Index for Canada (1949=100) - Revision based on 1957 Expenditures", DBS Catalogue No. 62-518 and in the January, 1969 issue of the monthly bulletin, Prices and Price Indexes, DBS Catalogue No. 62-002.

##### Consumer Price Indexes for Regional Cities (1961=100)

Consumer Price Indexes for Regional Cities are published monthly in this bulletin (Table 11). The regional indexes are similar in concept and item coverage to the Consumer Price Index for Canada except for their individual weighting systems.

Each index is designed to measure the influence of changes in retail prices taking place in the localities specified, upon the cost of a fixed basket of goods and services representing the level of consumption of a representative group of families in those particular areas.

In using the city indexes, it should be remembered that they are not indicators of comparative levels of prices as between the cities. That is, they do not in any way indicate whether prices are higher or lower in one city than in another.

For comparisons of retail price differentials between cities see Table 13 of this publication and the relevant explanatory note on page 72.

#### Measuring the Purchasing Power of Earnings

Changing consumer price levels affect the amounts of goods and services which a dollar will buy, and average earnings, of course, will be affected in the same way. An earnings measurement which takes the change of consumer prices into account, can be calculated by reducing actual earnings averages by the percentage amounts consumer price levels rise, or increasing them by the amount price levels fall. The adjusted averages may be used to indicate the comparative quantities of goods and services which could be purchased by average earnings if consumer price levels and consumption patterns had remained constant. The following illustration shows how this kind of an adjustment can be made.

Suppose that a series of average weekly wages rises from \$80.00 in week A to \$100.00 in week B, and that in the same interval a consumer price index advances from 100.00 to 110.0. Because of the 10 per cent rise in consumer prices, \$1.00 will not buy as much in week B as it would in week A. Likewise, a 25 per cent rise from \$80.00 to \$100.00 will overstate the increase which has occurred in the purchasing power of average weekly wages. This overstatement can be removed by reducing the figure of \$100.00 by the amount of the consumer price increase. The adjusted average is \$90.91 ( $100.00/110.0 \times 100.0$ ), which may be referred to as a weekly wage average for week B expressed in the dollars of period A, or it may be said to indicate the level of real weekly wages relative to week A.

The foregoing calculation can be carried a step further to express in index number form the relationship between the week A average of \$80.00 and the week B figure of \$90.91. Taking the week A average of \$80.00 as equal to 100.0, the week B index becomes 113.6 ( $90.91/80.00 \times 100.0$ ). Such an index may be called an index of weekly real wages. It indicates that average wages for week B will buy 13.6 per cent more goods and services than those received in week A, in spite of a 10 per cent rise in consumer prices. This 13.6 per cent increase in real wages compares with the rise of 25 per cent in money wages ( $100.00/80.00 \times 100.0$ ).

It should be noted that while the estimates of average real wages may reflect the experiences of broad groups of workers fairly well, their applicability to individual wage-earners depends upon a number of considerations. For example, individual earnings will differ significantly from the group average, depending upon occupation, industry, geographical location, or sex of the wage-earner. Moreover, individual spending habits differ widely, but the consumer price index which is used to adjust the earnings data refers only to the average consumption pattern of a particular income group. Group-spending patterns change over periods of time. To the extent that this occurs, the earnings data adjusted by the consumer price index (which has a "fixed" consumption pattern), will gradually be rendered less valid. Finally, some part of income may be saved, and it should be borne in mind that it is not appropriate to reduce savings to a constant dollar basis by using index which reflects consumption patterns.

It should also be kept in mind that measures of change in real earnings calculated from averages of gross earnings may differ from changes in the purchasing power of "take-home" pay, due to such factors as changes in personal income tax, pay deductions for such things as social insurance and pension plans. Thus index numbers of real wages should not be interpreted as measuring fluctuations in the levels of consumption of wage-earners or wage-earners' families; they are intended to show only the trend in purchasing power of wages over the items covered by the price index, and in addition to the factors already mentioned, do not take into account other family income (including family allowances) or changes in the savings position of families.

The table in this report showing indexes of both actual and real wages uses 1961 as a reference year. However, the adjustment made in the foregoing illustration can be applied to any reference level; percentage change between any two periods will be the same regardless of the reference period selected.

Indexes of Retail Price Differentials

Statistics previously published relating to differences in retail prices between Canadian cities have been updated to indexes measuring comparative food price levels. Table 13 summarizes the results of a detailed revision of earlier urban place-to-place food indexes and expands the scope of spatial retail price measurements to take in other elements of the family budget. A fuller explanation of the study from which this table is derived, including more details of these inter-city price comparisons, are contained in the November 1968 and November 1969 issues of Prices and Price Indexes (DBS Catalogue Number 62-002). In all, inter-city price comparisons were drawn for commodities and services comprising nearly three-quarters of the budget on which the Consumer Price Index for Canada is currently based. Major omissions are shelter (both rented and owned), domestic utilities (fuel, light and water), and restaurant meals. While recognizing the importance of shelter differentials in any overall comparison of the general price level being encountered by consumers in different urban centres, the problems inherent in drawing valid comparisons between cities are such as to require a good deal more research. Meanwhile, it is considered that, despite the absence of shelter differentials at this time, publication of retail price comparisons for other elements of the budget will go some distance towards serving the varied needs of users.

The original data base of this study was the wide range of retail price quotations collected in the course of production of the national and urban Consumer Price Indexes. In developing these spatial price comparisons efforts were made to achieve comparability by equating qualities of goods and services and by matching types of retail outlets, as far as possible. Price relationships between pairs of cities were derived and subsequently converted to a common base of Winnipeg prices equaling 100 to facilitate comparisons over the whole range of cities. The up-dating of these measurements of inter-city retail price differentials was accomplished by application of the relative movement of prices, at the item level in each city, over the intervening period as derived from the relevant city consumer price indexes. These price relationships at the item level were aggregated on the basis of the Canada urban consumer spending pattern, rather than the patterns applicable to individual cities. While differences in spending patterns exist among cities, the magnitude of these differences in the cities covered is not such as to affect most of the spatial comparisons significantly. Because of the previously mentioned absence of shelter price relationships, which may be of considerable significance in any overall comparison of inter-urban retail price differentials, aggregative indexes beyond major budget groupings are not shown.

It should be noted that the retail prices used in this comparison, being those faced by consumers, include sales and excise taxes as applicable. Variations between provinces in the scale of sales taxes imposed on a wide range of non-food commodities can be of significance in explaining inter-city price differentials for these items.

While these indexes have been expressed in terms of Winnipeg = 100, the selection of Winnipeg as the base city has no special significance, and the indexes may be expressed on the base of any of the individual cities included.
