PRICES & PRICE INDEXES

SEPTEMBER 1971

Farm Input Price Indexes relating to commodities and services used in Canadian farming operations are introduced on page iv of this publication on a revised basis. Revised indexes are presented for the period 1961 to the third quarter 1971, on a 1961=100 time base. A description of concepts, methods, and sources is included.

FARM INPUT PRICE INDEXES, 1961=100

Concepts, Sources and Methods

1. Introduction

Farm Input Price Indexes relating to commodities and services used in Canadian farming operations are introduced in this publication on a revised basis for the period 1961 to and including the third quarter 1971. Price indexes are published quarterly and annually for Eastern, Western, and all Canada on a 1961 time base, i.e., the 1961 index equals 100. In addition to the aggregate price indexes, indexes for component groups and a number of items are published, and a large selection of additional item price indexes relating to provinces and/or economic regions are available upon request. The indexes are shown in Table 2, page xx. Total and selected group price indexes are presented graphically in Charts 1 to 8 beginning on page xxxii.

Current price indexes will be published regularly in the quarterly publication, Statistics Canada Catalogue No. 62-004, Farm Input Price Indexes, 1961=100, formerly entitled Price Index Numbers of Commodities and Services Used by Farmers. They will also be carried in Table 14 of the monthly publication, Statistics Canada Catalogue No. 62-002, Prices and Price Indexes.

The Farm Input Price Indexes are designed to measure the movements of prices paid by farmers for inputs into farm production. Each of the two regional indexes and the composite Canada index measures the impact of price change on the cost of purchasing a constant 'basket' of inputs corresponding to the respective regions and Canada. The basket for each region represents the annual rate of use of inputs in farm operations in the region, in a specified base year. The Canada basket is the composite of the two regional ones. The indexes are price indexes reflecting only the direct impact of price change on the cost of purchasing the specified basket(s) of farm operation inputs.

The indexes are not cost of production indexes. Changes in cost of production result from many variables in addition to price, such as change in the quantities and qualities of the many items of controlled input, and changes in productivity which result not only from management and changing technology but also from weather and the many biological forces influencing crop and animal growth.

The indexes relate to all farming operations carried on in the specified base year on the combined group of agricultural holdings classified as small agricultural holdings and commercial farms. They are unlikely to reflect the effect of price changes on individual farms; nor are they likely to be a good reflection of price changes faced on particular types of farms, in which the mix of inputs is characteristically different from the average of all farms. In such cases, the individual item price indexes within the aggregate indexes may be re-weighted, with weights appropriate to each specific case, to yield more closely applicable aggregate indexes.

The item and group price indexes will likely serve a wider range of uses than will the aggregate indexes of which they are components. Therefore, a primary goal is to make available as much detail as possible to permit the combination of component series in accordance with a variety of criteria appropriate to particular uses. However, it is considered desirable to present the data in an orderly fashion, and the items are classified to four major groups, viz, Land and Buildings, Farm Machinery and Motor Vehicles, Hired Farm Labour, and Other Materials and Services. The materials and services assigned to each major group are itemized in Table 1, page xvi. The table also illustrates the relative importance of the item and group components and of the Eastern and Western aggregate indexes in the total Canada price index.

The Farm Input Price Indexes, 1961=100, replaces one of the two major component indexes in the previously published series, Price Index Numbers of Commodities and Services Used by Farmers, 1935-39=100. The latter index, which was suspended early in 1970, was composed of a Farm Family Living Index and a Composite Index Exclusive of Living Component. The Farm Input Price Indexes replaces the Composite Index Exclusive of Living Component from 1961 forward. A description of the major differences between the revised price index and the 1935-39 based series which it replaces, is contained in Section 10.

The Farm Family Living Index has not been revised at this time and its publication remains suspended. In any event, it is not planned to re-introduce a price index in which farm family living indexes and the farm input price indexes are combined. Such a combination is believed inappropriate because the two indexes relate to commodities and services purchased for quite different purposes and the interpretation and use of a combined index becomes ambiguous. The two price indexes should be used independently in analyses such as studies relating to the economic well-being of the farmer (see Section 9, page x).

2. History of Farm Input Price Indexes

Farm input indexes relating to Canadian farming operations were first introduced in August 1944 for Eastern, Western, and all Canada with 1935-39=100 as the time reference base. At that time, price indexes were presented annually from 1922 to 1939, twice yearly and annually from 1940 through 1943, and three times a year and annually beginning in January 1944. Average expenditures for operating items reported on a farm expenditure survey, carried out in 1938, provided the basis for the group weights. The item weights were based on a farm purchase survey carried out in 1942 with the co-operation of the Canadian Federation of Agriculture. In 1948, the price indexes were extended back to 1913 on an annual basis and the previously published indexes were revised from 1922 forward. The 1948 revision was relatively minor in scope involving some additions to and changes in item content, and some weight modifications primarily at the group level.

The Farm Family Living Index was first published annually in 1939 on a 1926=100 time base for the years 1913 to 1938 inclusive. The weighting pattern was based on a survey of farm family living expenditures carried out in 1934. Commencing in 1939, price indexes relating to April and August were published, in addition to the annual series. A weight revision based on 1938 expenditures was carried out and the revised series was first published in the spring of 1941 on a 1935-39 time base. In 1944, the Farm Family Living Index was combined with the price index relating to operating inputs back to 1922. Beginning in 1944, the price indexes became available three times each year. The 1948 revision resulted in a composite index which dates back to 1913.

In the years following 1948, the item content of both the family living and the farm operation indexes was changed to some extent in an attempt to reflect changes in varieties of items used by farmers. However, between 1948 and the present revision, there has been no change in the price reference period nor in the weighting diagrams at the group and sub-group levels.

3. Conceptual Framework of the Farm Input Price Indexes, 1961=100

The Farm Input Price Index measures the impact of price change on the cost of a constant base-year basket of capital, material, and service inputs in Canadian farming operations. It follows, therefore, that the appropriate weights representing the relative importance of items in the index should reflect the base year values of commodities and services used up or 'consumed' in the production process. In the majority of cases, for example, feed and fertilizer, base year expenditures can be assumed to reflect annual rates of use. However, in the case of capital inputs, the assumption is not valid and depreciation is used to reflect rates of use, and is termed "replacement cost" or "capital input allowances".

The index is designed as an integral component of a broad system of price indexes classified by industry, within the classification framework provided by the Standard Industrial Classification(1). Because of the wide range of uses for which the large body of official statistics are employed and the need for as much comparability as possible among related statistical series, a framework for co-ordination and integration is essential. The Standard Industrial Classification (S.I.C.) was developed to facilitate the production of comparable statistics based on data collected from a variety of sources. The accepted reporting unit is the establishment which is defined in the S.I.C. manual as "the smallest unit which is a separate operating entity capable of reporting all elements of basic industrial statistics"(2). An establishment is classified to a particular industry in accordance with its principal activity. Statistics Canada has moved rapidly toward an integrated system and almost all statistics relating to manufacturing industries, for example, are classified in accordance with the Standard Industrial Classification.

The application of the Standard Industrial Classification to agricultural activities presents particularly difficult problems, however. These problems stem primarily from the difficulties of securing sufficiently detailed data on the various economic activities carried out on agricultural holdings. Because surveys to obtain the essential data are costly, most of the statistics on agriculture relate to farming activity carried out on all agricultural holdings, including those which would not qualify as farm holdings under the standard classification criteria. For the Farm Input Price Index, data were available from an intensive survey for 1958 which permitted the index to be related specifically to farm holdings on which the principal activity was farming. This was achieved by basing the item content and weights of items on the aggregate of inputs into farming as reported in the 1958 survey for farm holdings classified as Commercial Farms and Small Agricultural Holdings. The items and their weights in the index are termed the index weighting diagram.

No one price index can be constructed to serve conceptually all uses and there are some for which activity-based price indexes may be more appropriate. Because S.I.C. farms constitute a very large proportion of all holdings engaged in farming activity, weighting diagrams based on S.I.C. farm expenses would be similar to those based on expenses of all holdings. For practical purposes, the price indexes calculated using S.I.C. weighting diagrams are judged to be not significantly different from indexes more specifically designed to cover total farming activity.

The revised price index weighting diagram incorporates inter-farm transfers, i.e., it includes purchases by farm operators from other farm operators. A weighting diagram which includes inter-farm transfers is termed "duplicated". While it is desirable for some purposes to use price indexes which include only those inputs flowing into farming from the non-farm sector, it is difficult to estimate the value of inter-farm transfers at the detailed level required to construct an unduplicated weighting diagram.

As indicated earlier, the price index is designed to measure the impact of price change on the cost of a constant base-year basket of operating inputs. The concept of price change can be explained in the context of separating changes through time in a value series, in this case the dollar value of farm inputs or farm operating and depreciation expenses, into its two principal components, viz, 'pure' price and quantity-quality changes. Therefore, in the measurement of 'pure' price change, changes in the value of farm inputs resulting from non-price changes, i.e., changes in quantities and/or qualities of inputs, are not reflected in price index movements. When varieties of items used in agricultural production change, prices are adjusted so that differences in the qualities of the old and new varieties do not move the price index. The techniques used in evaluating quality change and in adjusting for it are discussed in Section 7.

Conceptually, the index should reflect changes in actual transaction prices through time. Therefore, the use of list prices is not acceptable unless such prices are synonymous with transaction prices. It follows that the appropriate prices incorporate relevant sales taxes and are net of applicable discounts and subsidies.

A desirable attribute of an aggregate price index is that it be comparable in scope and content with corresponding statistics on dollar values, changes in which result partly from changes in prices. For the farm input price indexes, the most closely corresponding aggregate value series is Farm Operating Expenses and Depreciation Charges(3). For reasons of data difficulties cited above, this aggregate value series includes values of inputs into all farming activities, including those on holdings not classified as "farms". This somewhat larger scope and content is not considered to weaken seriously the comparability between it and the farm input price index.

Of more consequence for comparability could be the inability to exclude, from the price index weighting diagrams, the weight attributable to inter-farm purchases and sales. Such inter-farm transfers are minimal, if any, in the aggregate value statistics. Farm operating expense and depreciation values are used in conjunction with gross farm income values to derive measures of net farm income. For the most part, sales of farm products to other farmers are excluded from gross farm income because their inclusion would result in double counting. By the same token, purchases from other farmers are not included on the expense side of the ledger. To the extent that inter-farm transfers are involved, they are included in both the gross farm income and the expense estimates but cancel out in the net farm income series. The lack of comparability arising from inter-farm transfers can be minimized in specific applications through use of the item and/or sub-group price indexes within the aggregate index.

4. Index Weighting Diagram: Item Content and Weights

The item and group weighting diagrams used in the Farm Input Price Indexes are based on information from the 1958 Farm Income and Expenditure Survey, the most recent source of sufficiently detailed data on which to base item weights. The 1958 dollar values were modified to reflect 1961 prices and conditions insofar as it was feasible. It is theoretically

(3) Published in Farm Net Income, Statistics Canada, Cat. No. 21-202, Annual, Table 5.

desirable to have time and weight bases which relate to the same time period, i.e., 1961. However, in the absence of sufficient detail relating to the base year, it is appropriate to use data for a reasonably close period and adjust it to approximate base-year conditions. Provincial dollar values (quantities used in 1958 valued in 1961 prices) for each item were accumulated to Eastern, Western, and all Canada item weights, (W_0). In other words, the W_0 in the formula outlined in Section 8, can be expressed algebraically as $Q_{58} P_{61}$, where 'Q' represents quantity, 'P' price, and the numerical subscripts designate the year to which each relates. These weights expressed as percentages of the total base-year value for Canada are itemized in Table 1, page xvi.

In some cases where the survey was not sufficiently detailed or where 1958 data were considered suspect, auxiliary information was substituted or used to modify the survey data. The nature of such substitutions and modifications can be illustrated by the following examples. The survey provided very little data respecting the types of fertilizer materials purchased, and domestic sales were used to estimate the types of materials and weighting within the survey total of fertilizer. Between 1958 and 1961, there was an appreciable shift from gasoline to diesel machinery. The 1958 quantities implicit in the expenditures for gasoline and diesel fuel were not considered appropriate to 1961, and were adjusted using estimates of the change in the stock of the two fuel-use types of machinery between 1958 and 1961.

Because farm buildings constructed in successive periods tend not to be comparable, it is not possible to collect comparable prices for complete farm buildings. A feasible alternative is to price materials and labour employed in such construction. The 1958 survey did not provide suitable data for weighting the material and labour components. Estimates of the relative importance of appropriate construction inputs were obtained from Provincial Departments of Agriculture. Similarly, the custom work component is an approximation or proxy measurement based on price changes of the major inputs into custom work, with the weights based primarily on data published by the Canada Department of Agriculture.

As was indicated earlier, in the majority of cases, base year purchases are assumed to reflect annual rates of use. In the case of capital goods, purchases in the survey year reflect both changes to the stock of capital, and rates of use (replacement cost or depreciation) respecting the existing stock. Accordingly, replacement rates were calculated for both farm buildings, and machinery and motor vehicles, and were applied to the survey year stocks of capital valued in 1961 dollars to derive base year weights, i.e., replacement costs for these index components.

The weight for mortgage credit departs from the concept of rates of use (replacement cost) and relates, instead, to the average interest paid per farm in the base year on all mortgages outstanding at the end of the survey year. In other words, the weight constitutes the average survey year interest cost of all mortgage commitments regardless of when the commitments were made. This decision was made because the published aggregate value series for Farm Operating Expenses and Depreciation Charges produced by Statistics Canada incorporates total mortgage interest paid in each year, and it was considered appropriate to produce a price index which was consistent with the value series in this respect. The appropriate price series incorporates changes both in current interest rates and in previous years' interest rates. Interrelationships among the prices respecting the current and previous years are illustrated in Section 7. Weights appropriate to the aggregation of component price movements within total mortgage credit were derived from a model which yielded insight into the relative importance, in terms of principal outstanding, of current mortgages, one-year old mortgages, etc., in the base period.

The price index relates to farm business inputs and, therefore, only the farm share of motor vehicles and of the materials and services used in their operation are represented in the index weights for these items. The 1958 Farm Survey results provided the basis for making this adjustment. In the case of the house, it was assumed that its use for farm operation purposes was sufficiently small that the replacement cost associated with it could be excluded entirely from the weighting diagram. Accordingly, expenditures on property taxes, electricity, building repairs and mortgage credit were adjusted to exclude those portions which relate to the house.

The one level of weighting to which the foregoing discussion does not pertain, and which is not presented in the weighting diagrams, relates to the aggregation of price movements of varieties to obtain price indexes for individual index items. Varieties are simply sub-items representing a finer level of classification within an item. Because of lack of sufficiently precise information respecting the importance of each variety and of each outlet supplying prices, the variety price relatives (indexes) are combined to the item level as unweighted arithmetic means, in most cases. In addition, the price data available by variety suggest that there is not sufficient variability in price movements within each item by province to make necessary the use of variety weights. In other words, provincial item price indexes derived by weighting variety price indexes would not differ significantly from the unweighted indexes actually used in the index calculation.

5. Item Samples and Imputation

It is unnecessary, and sometimes very difficult, to collect prices for all the items which constitute the basket of goods and services to which a price index relates. For example, some items are sufficiently unimportant that the inclusion of specific price changes relating to them would not affect significantly group or total index movements. It is also true that many items belong to 'price families', i.e., groups of items for which price movements tend to be similar, and, therefore, the price movement of a 'family' can be represented by prices for a sample of items within that 'family'. In addition, the cost of development of price measurements, and the subsequent collection and processing of prices on a continuing basis, can be minimized by sampling without significantly reducing reliability. Lastly, from a conceptual and/or practical point of view, it is often too difficult to derive weights and prices for some items.

The major criterion for including items directly in the price index is their importance in the base-year basket of goods and services. In addition to the priced items, it is desirable to represent, through index weights, as many unpriced items as possible. The procedure for representing unpriced items in a price index is called imputation and, in theory, should be accomplished by assigning price movements of a priced item or items to the weight of unpriced items in the index calculation. In practice, because the above approach becomes unwieldy, the weights for the unpriced items are added directly to the weights for the appropriate priced items or groups.

Where possible, the 'price family' principle was employed in the imputation made in connection with the revised price index. Where there was no appropriate price series available to represent an unpriced item, the imputation was made at the group level. There are cases, however, where even the latter procedure was not considered appropriate and such items were omitted from the index altogether. For example, livestock for breeding purposes was omitted from the weighting diagram on two counts, viz, (i) the difficulty in deriving appropriate weights, and (ii) the lack of appropriate specific or related price series. Other exclusions encompass the returns to management, equity capital of the farm operator and his family, and unpaid

Family labour, for which it is not practical to obtain prices for units of such inputs(4).

It would be desirable and feasible, from a practical point of view, to represent directly in the price index some items and/or groups of items for which prices are not collected currently. These items include pesticides, weedicides, non-mortgage credit, and veterinary expenses. While it is unlikely that their inclusion would affect significantly the movement of the major group price indexes, price series for them would be useful in their own right. They are not included directly in the revised index because of the time and resources required to develop appropriate price indexes.

6. Prices, Price Sources, Frequency of Pricing

Ideally, the index should reflect price movements at the farm gate, i.e., farmers' buying prices, which suggests that all prices should be collected directly from farmers. However, it is impractical to collect prices for all material and service inputs directly from farmers. Individual farmers purchase infrequently items such as farm machinery and existing models are periodically changed and new ones introduced. Therefore, it would be impossible to collect prices for identical specifications through time and difficult to evaluate quality changes when specifications did change. Further, farmers are scattered across the country and the cost of personal and telephone contact necessary would be prohibitive. As a result, prices are collected directly from farmers for a few items only, e.g., hired farm labour and property taxes, while prices for the majority of items are obtained by mail from judgment samples(5) of outlets which sell directly to farmers. The resulting price indexes are considered to be acceptable indicators of the changes in farmers' buying prices.

In some cases, prices collected primarily for use in other price indexes have been used to construct proxy measurements of price change as it affects farmers. For example, urban prices for automobiles collected for the Consumer Price Index are used to construct price series for automobiles in the Farm Input Price Index. Farmers do purchase automobiles in urban centres, and rural automobile dealers are forced to be competitive. Furthermore, because the urban prices are collected by Statistics Canada field agents, they are likely to be more reliable than automobile prices collected by mail in rural areas. Fertilizer prices collected primarily for use in the Industry Selling Price Indexes are used to represent the price movement of fertilizer in the Farm Input Price Index. To the extent that dealer margins remain fairly constant through time, the derived series are believed to be good indicators of the movement of prices paid by farmers.

Prices are collected monthly for the majority of items which exhibit large and/or variable month to month price movements, e.g., feed and fertilizer. In most other cases, prices are collected four times each year, viz, February, May, August, and November. Annual prices are appropriate for some items, e.g., property taxes and motor vehicle licenses. However, in the case of other items, e.g., mortgage credit, appropriate data are available only on an annual basis, even though it would be desirable to collect prices more frequently. With respect to most of the monthly and the quarterly price quotations, the data collected relate to the first week in the pricing month. Prices collected for fertilizer and hired farm labour relate to the fifteenth of the month, and average monthly prices published by the Canada Department of Agriculture are used to measure price movement for feeder cattle.

Price sources and frequency of collection are summarized in the three tables beginning on page xiii. The sources of ~~price data~~ used in the index and the frequency of pricing are presented in Table I, for each index item. Seven sources are distinguished and five different frequencies of pricing are specified.

The relative importance of each source of prices is summarized in Table II, page xiv, in terms of the total base year ~~weights of~~ the corresponding index items. It is evident, for example, that over 80% of prices used in the index are collected directly from farmers or from dealers and other commercial outlets selling directly to farmers.

Similarly, the relative importance of the various frequencies with which pricing is carried out is shown in Table III, page xiv. While it can be seen from this table that over 80% of the prices (by weight) are collected at least as frequently as four times per year, many of the 11% collected annually do not change more than once a year and are suitable for inclusion in a quarterly index.

There are a number of index items and/or groups for which the derivation of price series warrants specific discussion. In all these cases, there are major difficulties in collecting appropriate specific prices for use in the index. While it is felt that the derived price movements are sufficiently reliable indicators of price change, it is important that users are aware of their composition and of their possible limitations.

In Section 4, reference was made to the derivation of appropriate weights for constructing an input price index for farm building replacement. The price index is produced by aggregating price movements of materials and labour to represent the movement of the prices of the final product, viz, buildings. This approach is used in the production of many construction price indexes in Canada and in other countries. One of the criticisms of this proxy measurement is that it fails to account for changes in productivity in construction, and in profit margins, through time. This criticism is probably less valid in the case of own-account construction on farms where many farmers purchase the inputs separately, and do not have the advantage of new technology to the extent that the large scale contractor does.

The farm machinery and motor vehicle repairs index is another input-type price index. As with farm building replacement, the input approach is appropriate to the extent that farmers buy repair parts and provide their own labour. It is a substitute price index (proxy) insofar as farmers purchase complete repair jobs. The labour weight excludes the labour, of the farm operator and his hired help, used in machinery and motor vehicle repair. With respect to the labour component in both farm machinery and motor vehicle repair, mechanics' wages collected from a sample of rural garages and gas stations are used to construct the price series. The motor vehicle parts prices come from the range of automobile repair parts prices collected from urban areas for the Consumer Price Index. The price movement of farm machinery parts is based on the non-power machinery price index. The recent Royal Commission on Farm Machinery published, in a final report(6), a repair parts price index for the years 1963 to 1967 inclusive. Because of the short time span covered by the index, it was not incorporated into the total repairs input price index. Although there were variations among company price series, components of the Royal Commission's index, the nature of the dispersion suggested that the non-power machinery price index would serve as a sufficiently reliable

(4) Returns to management, equity capital and unpaid family labour are included in the Net Income of Farm Operators rather than in Farm Operating Expenses and Depreciation Charges (see page v).

(5) Samples in which selection of representative outlets is based on knowledge of characteristic differences among outlets, rather than by random selection procedures.

(6) Royal Commission on Farm Machinery, Report of the Royal Commission on Farm Machinery, Ottawa, Information Canada, 1971, Chap. 31, p. 569.

substitute on an interim basis. The feasibility of producing, on a continuing basis, an actual repair parts price component is being investigated.

Custom work also is an index item for which price movements of the service are represented by price indexes of the inputs required in carrying out the work. The input components include farm machinery replacement and repairs, appropriate farm machinery operation inputs, and farm labour. It is primarily a proxy measurement for price movements of custom operations such as ploughing and combining and may not represent adequately other operations such as aircraft spraying and dusting. In addition, it does not take account of changing profit margins.

Share rent is an item for which direct pricing is extremely difficult. Both the tenant and the landlord know what the rent payment is, in terms of the share of the volume of realized output. However, a final value cannot be attached to the output, of crops, for example, at least in the Prairie Provinces, until the Canadian Wheat Board has announced final participation payments. Under these conditions, share rent cannot be determined in dollar terms until production is known and valued. In lieu of direct pricing of share rent, the approach outlined above is simulated using available production data valued in final prices, when the latter become available. Because the price index of share rent varies according to the value of output, this index component is subject to continuing revision. Furthermore, changes through time in the landlord's share are not known and an assumption that it remains constant is implicit in the calculation.

The index for the cash rent component is based on the price movement of land and buildings and of property taxes through time. A limitation of this approach is the fact that it does not account for changing profit margins of landlords. In addition, necessary information on land, buildings and property taxes is not available until the beginning of the following year and, therefore, the cash rent price index for a current year is subject to revision. More direct data respecting cash and share rent paid will be available in 1972 from a sample survey of farmers carried out by the Agriculture Division, Statistics Canada. It is hoped that the survey results will provide a more appropriate measurement of price change for cash rent. The survey will not solve the timeliness problem for either cash or share rent, nor is it likely to provide a viable alternative to the present approach for share rent. However, the resulting data will be of assistance in evaluating the reliability of price movements.

7. Treatment of Quality Change

In accordance with the definition of 'pure' price change discussed earlier in part 3, prices used in the index must relate to comparable units of purchase through time. Consequently, prices are collected for identical specifications of goods and services in each pricing period. In this connection, the term "specification" embraces the important physical characteristics of each item and the terms of sale. However, specifications do change over time, and if adjustments were not made when existing varieties are modified or disappear from the market and new ones become available, a price index would gradually become a less and less reliable measure of current price movements. Therefore, when new varieties do become available and replace existing varieties in the index, prices must be adjusted to comparable qualities.

The technique, which is used most extensively for this purpose in the Farm Input Price Index, is based on the premise that relative prices of the old and new varieties on the market at the same time provide a meaningful indication of their relative qualities. In other words, the dollar value placed on the quality change by the market is reflected by the price difference between the old and new varieties at a point in time. The following algebraic example illustrates the 'market overlap' approach to the adjustment of prices for quality change.

Let \hat{P}_{B2} be the price of variety B in time period 2, adjusted for comparability with variety A

$$\text{Then } \hat{P}_{B2} = \frac{P_{A1}}{P_{B1}} \times P_{B2}$$

Where P_{A1} = market price of variety A in time period 1

P_{B1} = market price of variety B in time period 1

P_{B2} = market price of variety B in time period 2

and $\frac{P_{A1}}{P_{B1}}$ = relative qualities of A and B in time period 1

Hence the price index (I) measuring pure price change between time periods 1 and 2 is expressed as $I_2 = \frac{\hat{P}_{B2}}{P_{A1}} \times 100$

In a very few cases, e.g., automobiles, a 'cost of production' approach is used to evaluate and adjust for quality change. The technique is based on the assumption that the ratio of direct costs of labour and material inputs for the old and new varieties is indicative of their relative qualities. The materials and labour costs of both varieties are valued in prices relating to a common time period and are adjusted to a common technology. To date, it has not been possible to include capital costs in the adjustment procedure.

The foregoing conventions for evaluating changing product quality and eliminating its effect on price indexes, and other alternative approaches, are described in more detail in Industry Selling Price Indexes, 1956-1968, Statistics Canada, Catalogue No. 62-512, pages 13-23 and Appendix B, pages 171-172.

The treatment of both quality and quantity change in the hired farm labour component warrants particular discussion. With the exception of wage rates collected for farm labour hired both with and without board and/or lodging, Statistics Canada has not been able to price labour to specification and, therefore, available average wage rates relate to different 'baskets' of farm labour in each time period. The revised price index incorporates wage data relating only to labour hired without board and/or lodging which effectively eliminates that particular aspect of quantity change. However, changes through time in the latter average wage rates reflect a combination of changes in the level of skills, in the number of hours worked per day and per month, and in 'pure' price.

The daily and monthly wage rates, particularly in the Prairie provinces, exhibit large seasonal swings. It is felt that these seasonal movements are primarily a function of changes in hours worked rather than in price and, therefore, they should not be allowed to affect index movement. If data on hours worked per day and per month were available, the reported rates could be converted to an hourly basis and the problem would be minimized. The required data on hours worked are not available and an alternative technique has been employed, viz, basic wage rate series which exhibit seasonal movements are seasonally adjusted.

To the extent that inter-year changes in skills and numbers of hours worked have occurred, the resulting trend-cycle incorporates some quantity-quality movements. It is likely that skills have increased since 1961. However, some evidence is available which suggests that hours worked have declined over the period and this reduction in the quantity of labour would tend to compensate for the quality increase in skills.

Mortgage credit constitutes another area for which some specific discussion respecting quality change is necessary. The appropriate prices through time relate to interest paid for units of mortgage credit outstanding, identically specified in each pricing period. It would be desirable to define a set of specifications for representative samples of new mortgages (those contracted in the base year), one-year old mortgages, two-year old mortgages and so on, and to collect prices (interest paid) relating to such specifications through time. For example, one of the set of specifications might relate to a "15 year mortgage with 13 years to run, on 200 acres of class one agricultural land with one building of given characteristics, and with a down payment of 25% of the purchase price". For such a specification, changes through time in both the interest rate and in the purchase price of the land and building would contribute to the change in the interest paid (price) for mortgage credit. The change in that component of interest paid which results from change in the purchase price of the land and buildings can be defined as a change in the quality, i.e., purchasing power, of the borrowed money.

Unfortunately, practical difficulties preclude the collection of mortgage credit prices in accordance with the foregoing outline. As an alternative, the average principal outstanding per farm, for all mortgages outstanding at the end of the base year, is adjusted for change in quality (purchasing power) each year using a price index of farm land and buildings. If, during periods of increasing land values, farmers must borrow more dollars to purchase identical parcels of real estate in two time periods, and if the decline in the value of the dollar is inversely proportional to the increase in the price of farm land and buildings, the approach is valid. The relevant interest rates are subsequently applied to the updated (adjusted) mortgage value in each time period to yield appropriate comparable prices for mortgage credit. Reference was made in Section 4 to the role of current and previous price changes in the movement of the mortgage credit component, and their interrelationships respecting the aggregate price change between t_0 (base period) and t_1 , are outlined in the following table.

Interrelationships Among Current and Previous Years' Price and Quality Changes on the Price Index for Mortgage Credit in Time Period 1

(Time Period $o = 100$)

Age of mortgage contract in base year	Weights: principal outstanding in base year	Interest rates appropriate to price in to	Prices in to Col. (2) X Col. 8. Index Formula and Index Calculation

The Farm Input Price Indexes are calculated using a base weighted or Laspeyres index formula, i.e.,

$$I_t = \frac{\sum W_0 (P_t/P_0 \times 100)}{\sum W_0} \text{ where}$$

I_t = price index in time t

W_0 = base-year value weights for each item (see Section 4, Index Weights)

$\frac{P_t}{P_0} \times 100$ = price for each item in time period 't' as a percentage of price in base period 'o'.

Σ = summation over items

The use of item weights, W_0 , in the calculation ensures that each item price change, $\frac{P_t}{P_0} \times 100$, contributes to the overall price

change in accordance with the importance of that item in the base-year basket of commodities and services.

Price indexes are calculated monthly for items and groups for which prices are available on that basis, and quarterly indexes for such items are unweighted averages of the three monthly price indexes relevant to each quarter. In many cases, prices are available only four times each year, viz, for the mid-month in each quarter. The price indexes calculated for each mid-quarter month are used to represent the quarter. With respect to some items, annual prices only are available and the price change associated with these items affects the index between the fourth quarter in one year and the first quarter in the subsequent year. Prices are collected three times each year for seed items and twice a year for tires and automobile repair parts. In these instances, quarterly indexes, based on prices appropriate to the quarter, are carried nominally in quarters for which prices are not available. Annual average price indexes are calculated as unweighted averages of the four quarterly price indexes for each year. Tables I and III, pages xiii and xiv, provide an indication of the frequency of pricing by item and/or group.

The above formula can be used to produce a price index for any two or more item and/or group price indexes according to any desired combination. The weights in Table 1 for Eastern and Western Canada are additive in any direction and can be used in any combination for this purpose. For example, if a user wished to combine Eastern Canada building replacement with building repair price indexes for the second quarter, 1971, he would perform the following calculation.

$$I_{2Q'71} = \frac{(Weight \times Index) \text{ for building replacement} + (Weight \times Index) \text{ for building repair}}{\text{Sum of the Weights}}$$
$$= \frac{(3.151 \times 159.7) + (1.198 \times 153.9)}{3.151 + 1.198} = \frac{687.5869}{4.349} = 158$$

The above methodology may also be employed to combine selected price index components using weights, either actual dollar values or percentages, which are more appropriate to the user's specific requirements. For example, a specific escalation contract may require a price index based on weights (inputs) which are not in the same proportions as in the official indexes.

It is important to note, however, that in any recombination of item or group price indexes, weights and price indexes of components must relate to the same time period. To use the price indexes presented herein, weights must relate to 1961. If available weights are for some other year, users have two alternatives, viz, (i) update or back date the weights for each item (or group) to 1961, by adjusting them for price change between the year to which the weights relate and 1961, or (ii) arithmetically convert the price indexes presented herein to the time base of the weights, by dividing the given indexes by the index of that year and multiplying by 100. The latter conversion does not change the movements of prices in terms of percentage changes from period to period, but does modify them in terms of index point changes because they relate to a different index level.

9. Index Uses and Limitations

Throughout this section, users are encouraged to combine component price indexes, within the aggregate farm input price indexes, to serve particular uses for which the given aggregates may not be appropriate. The methodology for this purpose is described in the foregoing section. In this connection, there is a variety of price indexes for Eastern and Western Canada which are too detailed for regular publication but which can be made available to users on request. There is also a range of item price indexes available by province, or by economic region, i.e., the Prairies and the Maritimes, though there are not enough of them to produce total price indexes for these geographic areas.

Deflation — A use for which the components of the Farm Input Price Index are well suited is to break out changes in the dollar value series of farm operating expenses into two principal components, viz, 'pure' price, and quantity-quality changes. The value series are deflated by the price indexes to derive measurements of changes in real inputs, i.e., quantity-quality, through time. The deflation procedure should be carried out at the lowest level of detail for which value series are available. Component real inputs may then be aggregated to a total base-weighted real input series. Real inputs are important ingredients in the construction of aggregate economic indicators and in productivity studies, etc.

The price index and its components do not match exactly the official published statistics on the value of Farm Operating Expenses and Depreciation Charges, for the reasons outlined previously under Section 3; the price index weights include inter-farm transfers and the farm expense series do not, and the two indicators relate to somewhat different universes. However, for all practical purposes, aggregate price indexes calculated using unduplicated weights (excluding inter-farm purchases) relating to the activity Agriculture would not differ significantly from the price indexes presented herein. However, for some components, the revised price indexes which are based on duplicated weighting may differ somewhat more from indexes based on

unduplicated weighting. Hence, for deflation purposes, their selection should be carried out with care. For example, the prepared feed price sub-group index is likely a better match for the feed expense component of the dollar value series, than the feed price group index which combines price movements of prepared feed and feed grains.

Contract Escalation — Another use of the price index components is in contract escalation. It must be remembered that the total price index relates to agricultural holdings classified as farms in the Standard Industrial Classification and, therefore, is unlikely to be an appropriate statistic for use in any specific escalation contract relating to particular commodities or particular types of farming. Pertinent item and/or group price indexes should be selected and aggregated using value weights appropriate to the particular case. For example, in the case of a milk pricing formula, it would probably be appropriate to select the price indexes relating to inputs into dairy farming and to aggregate them using values (weights) reflecting inputs in dairying activity on dairy farms.

Cost-Price Squeeze — Traditionally, the price index of farm inputs in combination with the price index of farm family living costs has been widely used in comparisons with the 'Index Numbers of Farm Prices of Agricultural Products' (7), to determine the 'cost-price' squeeze on farmers. The comparison yields only a first indication of possible changes in the economic well-being of farmers and, therefore, is not conclusive and can be misleading. The farm input price index indicates changes in price per unit of input, whereas the index of prices received by farmers measures changes in price per unit of output. In a more conclusive indication of the cost-price squeeze, the prices 'paid' and the prices 'received' indexes should relate to a common unit, viz., output. If appropriate productivity indexes (output per unit of all inputs) were available, the input price index could be converted to an index of cost per unit of output. The latter unit cost index in conjunction with the index of prices received for farm output would provide a more appropriate indication of the squeeze between costs and returns in agriculture. Unfortunately, the necessary productivity measures are not available in official statistics. Users should not rely, therefore, on price index comparisons alone, and other available statistics on costs, receipts, and outputs in Canadian agriculture must be brought to bear on the assessment of changes in the cost-returns relationship. Farm family living price indexes should not form an integral part of the above analysis. However, they are useful tools in measuring the economic well-being of farmers and, in this connection, should be related to changes in net income.

In addition to the above examples, the price index and its components are put to a variety of analytical uses. It is desirable that users understand the meaning and limitations of the series, and their applicability in each particular use.

The meaning of long term historical price series is suspect and difficult to interpret, primarily because of significant changes in the 'basket' of commodities and services used by farmers, for example, between 1938 and 1961. Even in the case of one item, e.g., ploughs, the relevance of a price index becomes indeterminate when the 1938 variety was a walking plough and the 1961 variety, a tractor mounted plough.

It might be argued that the last twenty years is a realistic time span over which to produce a continuous price series. However, the item coverage in the revised price index is appreciably broader than in the 1935-39 based series and, in many cases, it is almost impossible to match the post-1961 component price indexes with the pre-1961 series. Data are not available to permit the development of additional price series nor to revise existing price indexes for the 1950-60 period. Methodological changes such as the use of seasonally adjusted price indexes for hired farm labour in the revised price index render invalid some comparisons between the pre and post 1961 periods. For example, if the 1935-39 based price index for hired farm labour were linked to the revised index in 1961, the indicated price changes between August 1960 and the third quarter 1961 would not be valid because the latter index has been adjusted for seasonal price movements whereas the 1935-39 index was not. Similarly, the linking of the 1935-39 aggregate index to the revised price index would yield a historical index series which would reflect that same distortion. However, annual average price indexes calculated from seasonally adjusted series are identical to their unadjusted counterparts. Therefore, the change in methodology does not distort annual price comparisons between years prior to 1961 and the post-1961 period.

For the foregoing reasons, the 1935-39 based price indexes have not been linked to the revised series to provide official historical indexes back beyond 1961. However, some users will have a requirement for historical price indexes prior to 1961. While it is likely that the total 1935-39 based index overstates price change to some extent between 1950 and 1961, the overstatement is probably less than what users might expect, because of the nature of the price dispersion among component groups. For example, although there was an appreciable shift from labour to machinery capital input between 1938 and 1950, the price change respecting these two components was very similar from 1950 to 1961. As a result, the aggregate price change over the 1950-61 period using revised weights for machinery and labour would not differ appreciably from the change measured using the 1935-39 based price index. Therefore, for those users who must have a historical price index back to 1950, for specific application, a linked series based on the 1935-39 weighted index from 1950 to 1961 and the revised index subsequent to 1961, may be sufficiently meaningful. Users are invited to contact the Prices Division of Statistics Canada with respect to linking procedures and their validity in specific uses.

Limitations of particular group and/or item price indexes have been discussed in the sections relating to the derivation of weights, price series and the treatment of quality change.

10. Relationship Between Revised and Former Price Indexes of Farm Inputs

The concepts underlying the Farm Input Price Index, 1961=100, do not differ appreciably from those relating to the 1935-39 based price index. Most of the changes in methodology result from expanded knowledge of index number theory and practice, and survey feasibility. The major advantages of the revised price index and its components over its 1935-39 based counterpart include the following:

- (i) The revised price index incorporates updated weighting diagrams.
- (ii) The new price index is based upon larger and more representative price samples relating to items which were included in the old price index. The reliability of the item price series is improved appreciably as a result. For example, the new index incorporates price movements for farm labour hired by the month, day, and hour, while the old series was based only on monthly farm labour.
- (iii) In addition to increased reliability, the larger samples permit the production of price indexes at lower levels of detail than was hitherto possible. For example, prior to this revision, farm machinery price indexes were produced only at the total machinery level. However, price indexes are now available for eleven motor vehicle and farm machinery items for Eastern, Western and all Canada.

- (iv) The item coverage is broader in the revised index, both with respect to direct pricing and to reliable proxies. For example, all building construction and repairs were represented by a building materials price index in the 1935-39 based series. The revised price index incorporates price index components based on both material and labour input prices for building replacement (depreciation), and building repairs. It also incorporates proxies relating to farm rent, machinery and motor vehicle repairs and custom work, and price series relating to new items such as motor vehicle insurance and licenses, and electricity.
- (v) The revised price index will be published quarterly instead of three times each year.

The combined effect of the improvements outlined above is that the aggregate revised price indexes have increased appreciably less, since 1961, than did the old index series. Between 1961 and 1969, the average annual rate of increase in the 1935-39 based price index, and in the revised price index, was 4.7% and 3.2% respectively for all Canada. The introduction of updated weights constitutes the primary reason for the different rates of increase in the old and revised price indexes. For example, the weight for hired farm labour is less in the revised price index than it was in the 1935-39 based series. In addition, from 1961 to date, the price of labour has increased at a greater rate than the prices of other index components in both the revised and the old series. It follows that the larger weight, in combination with the price movement associated with labour, has caused the aggregate 1935-39 based price index to increase more rapidly than its revised counterpart.

The net effect of the revised prices and expanded variety coverage relating to items which are components of both the old and the revised price indexes, and of the introduction of prices respecting new items, is small. The effect of revisions to prices of items common to both price indexes was to lessen the rate of price increase over the period, but this was offset by prices for the new items incorporated in the revised indexes which tended to rise at a greater than average rate.

Table IV, page xv, provides a more detailed listing of the components of the old and revised price indexes and a brief description of differences between them.

11. Maintenance of the Price Index as a Reliable Indicator of Current Price Changes

The index number problem associated with the use of base weights to aggregate component price series was referred to in the section on index uses and limitations. Respecting the problem and its impact on the revised price index, production inputs for which prices are rising less rapidly tend to be substituted on a more or less continuing basis by farmers for those inputs with more rapidly rising prices, e.g., the substitution of capital for labour, in order to reduce production costs. As a result, it cannot be assumed that the base weights adequately reflect farm inputs in the current period. Therefore, procedures for ensuring the relevance of the aggregate index as an indicator of current price changes are being instituted. The changing relative importance of sub-groups through time will be monitored on an annual basis, using available statistics on farm operating expenses and depreciation charges, and the index weights at that level will be modified when necessary. The use of this procedure to evaluate the relevance of the 1961 base weights over the past decade has verified that the aggregate movement is a meaningful measurement of price change from 1961 to date.

Unfortunately, appropriate data are not readily available to monitor base weights at the item level. However, there are a number of data sources which are being explored, such as the federal and provincial government farm management accounting systems and relevant Statistics Canada data relating to manufacturers' shipments and dealers' sales.

On the price side, plans have been made to monitor price samples on a continuing basis and to revise them when necessary. In addition, a programme is being developed to expand the direct price coverage to many of the items for which proxy price measurements are employed in the revised price index, and to develop price indexes for certain groups which are represented currently only by imputation.

TABLE I Price Sources and Frequency of Pricing - Farm Input Price Indexes, 1961=100

	Price sources							Frequency of pricing				
	Rural dealers	Other commercial outlets	Farmers(1)	Other gov't. departments	Business associations	Industry selling price indexes	Consumer price indexes	Monthly	February May August November	3 times per year	2 times per year	Annually

(1) All data under the heading "Farmers" are collected by Statistics Canada. However, some of the data are collected and partly processed by the Agriculture Division rather than the Prices Division.

(2) Prices for automobiles are collected 8 times per year for the Consumer Price Index. When a C.P.I. pricing month coincides with the mid month of the quarter, that price is used in the Farm Input Price Index. When they do not coincide, prices for the months on either side of the mid month are averaged.

(3) Price schedules respecting these items are not sent monthly to respondents. However, respondents report monthly changes which have occurred during the quarter.

TABLE II. Relative Importance(1) of Price Sources in Farm Input Price Indexes

Price sources	Eastern Canada	Western Canada	Canada
per cent			
Dealers in small towns and rural areas	56.5	56.7	56.6
Other commercial outlets selling directly to farmers	4.8	4.4	4.6
Farmers	20.6	23.0	21.7
Federal and provincial government departments	5.8	5.3	5.6
Business associations	2.9	1.8	2.4
Industry selling price indexes	6.2	3.2	4.8
Consumer price indexes	3.2	5.6	4.3
All sources	100.0	100.0	100.0

(1) Relative importance measured in terms of the base year weights of index items, for which prices are collected from the indicated sources, in the Eastern, Western, and all Canada total price indexes.

TABLE III. Relative Importance(1) of Frequencies of Price Collection in Farm Input Price Indexes

Frequencies of price collection	Eastern Canada	Western Canada	Canada
per cent			
Monthly	42.7	20.6	32.5
4 times per year	44.1	58.4	50.8
3 times per year	3.2	3.3	3.2
2 times per year	1.6	3.3	2.3
Annually	8.4	14.4	11.2
All frequencies	100.0	100.0	100.0

(1) Relative importance measured in terms of the base year weights of index items, for which prices are collected according to the stated frequencies, in the Eastern, Western, and all Canada total price indexes.

TABLE IV. Comparison of Major Differences in Content between 1935-39 and 1961 Based Farm Input Price Indexes

1961 based index groupings	1935-39 based index groupings	Comments
Total indexes	Total indexes	
Land and farm buildings	N/A	
Building replacement	Building materials	(1) 1961 index includes labour and materials, 1935-39 index materials only. (2) Item content and weights within materials differ.
Building repairs	Building materials	See notes re building replacement.
Fencing construction and repairs	N/A	(1) 1961 index includes materials only. (2) Hardware component of 1935-39 index includes some fencing materials.
Mortgage credit	Mortgage interest	(1) Additional data brought to bear on 1961 index. (2) Methodology used differs significantly.
Property taxes	Property taxes	
Farm rent	N/A	
Farm machinery and motor vehicles	N/A	
Machinery and motor vehicle replacement	Farm machinery	(1) Item content and weight differences, e.g., 1961 index includes automobiles, 1935-39 index does not. (2) Completely new source of prices employed in 1961 index.
Machinery	Farm machinery	See notes for farm machinery and motor vehicle replacement. In addition, 1935-39 index includes trucks, 1961 index does not.
Motor vehicles	N/A	1961 index includes automobiles and trucks.
Machinery and motor vehicle operation	N/A	
Petroleum products	Gasoline, oil and grease	1935-39 index includes diesel fuel and batteries, 1961 component excludes batteries.
Repairs, tires and batteries	N/A	See above for treatment of batteries in 1935-39 index.
Motor vehicle licenses and insurance	N/A	
Hired farm labour	Farm wage rates	(1) 1961 index includes monthly, daily and hourly rated labour without board. (2) 1935-39 index includes monthly rated labour, with and without board. (3) 1935-39 index is not seasonally adjusted. Some components of 1961 index of hired farm labour are seasonally adjusted.
Other materials and services	N/A	
Fertilizer	Compounded fertilizer	Item content and weights differ.
Seed	Seed	(1) Item content and weights differ. (2) Completely new source of prices employed in 1961 index.
Custom work	N/A	
Feed	Feed	Item content and weights differ.
Artificial insemination	N/A	
Feeder cattle	N/A	
Small tools and supplies	Hardware	Item content and weights differ, e.g., 1961 index includes twine, 1935-39 index does not; 1935-39 index includes some fencing materials, 1961 index does not.
Electricity	N/A	
	Twine	Twine is treated as a group in 1935-39 index, as an item in small tools and supplies in 1961 index. Unpublished 1961 index for twine is available.

N/A No corresponding price indexes.

TABLE 1. Weighting Diagram(1) — Farm Input Price Indexes, 1961=100

	Eastern Canada					Western Canada					Canada				
	Major group	Group	Sub-group	Item type	Item	Major group	Group	Sub-group	Item type	Item	Major group	Group	Sub-Group	Item type	Item
per cent

(1) The percentage weights indicate the relative importance of the components in the Canada aggregate of total inputs. The weights include all imputations made at the item and group levels as described in Section 5 of the text. The weights are additive within the Canada aggregate, and within and between the Eastern and Western aggregates. On that basis, the percentages may be used in any combination to aggregate two or more item and/or group indexes according to a variety of criteria. The weights are expressed to three decimal places to ensure greater accuracy in the combination of components which are relatively small in the Canada total. The methodology for using the weights to combine component indexes is outlined in Section 8.

(2) Farm share only. See text, Section 4.

— Nil or zero.

TABLE 2. Farm Input Price Indexes

Total, and Selected Group and Item Indexes, Annually 1961 to 1970 and Quarterly to Third Quarter 1971

NOTES ON PRICES AND PRICE INDEX NUMBERS

Industry Selling Price Indexes (1961=100)

Industry selling price indexes were higher in September than in August for 37 manufacturing industries, lower for 24 and unchanged for 39.

In terms of the relative importance of industries within manufacturing the more notable changes in September were increases recorded in the foods and beverages group reflecting higher price levels in the butter and cheese plants, pasteurizing plants, condenseries and breweries industries. Moderate declines occurred in the wood products group as a result of lower prices in the sawmills and planing mills industry, and in the primary metals group where price decreases were registered for the smelting and refining industry.

The arithmetic average of the 100 industry indexes was 123.5 in September, the same as in August. The average (unweighted) increase for those industries showing higher price movement was 0.9%, while the comparable figure for those showing decreases was 1.2%.

August to September Changes in Industry Indexes

	September/August			Major group indexes		
	Number of industries			Sept. 1971	Aug. 1971	Sept. 1970
	In- creases	De- creases	Un- changed			
All industries	37	24	39	(1)	(1)	(1)

(1) Indexes not available at this level of aggregation.

General Wholesale Index (1935-39=100)

The general wholesale index moved down 0.1% in September to 291.6 from the August index of 292.0. It was 2.5% higher than the September 1970 index of 284.4. Four of the eight major group indexes were lower, while four advanced.

The vegetable products group index moved 1.4% lower in September to 232.8 from 236.0 on price decreases for potatoes, sugar and its products, grains, livestock and poultry feeds, and vegetable oils. A decline of 0.9% to 259.9 from 262.2 in the non-ferrous metal products group index was chiefly attributable to lower prices for silver and export sales of refined copper. The chemical products group index moved down 0.5% to 238.8 from 240.0 as lower prices for fertilizer materials outweighed price increases for soaps and detergents and organic chemicals. A decline of 0.4% to 403.7 from 405.3 in the wood products group index reflected price decreases for cedar, pine, spruce and building board.

The animal products group index rose 0.8% to 330.4 from 327.9 mainly on higher prices for milk and its products, cured meats and eggs. The textile products group index moved up 0.6% to 263.9 from 262.3 in response to price increases for cotton fabrics and raw cotton. Increases of 0.2% or less occurred in two major group indexes; non-metallic mineral products to 227.1 from 226.7 and iron products to 318.4 from 318.2.

The following table shows some of the more noteworthy changes:

Commodity group and sub-group	Percentage changes		
	Sept. 1971 Aug. 1971	Sept. 1970 Aug. 1970	Sept. 1971 Sept. 1970
Vegetable products group	- 1.4	+ 0.4	- 2.1
Potatoes	- 29.9	- 39.6	- 12.0
Livestock and poultry feeds	- 4.2	+ 7.5	- 3.4
Sugar and its products	- 3.5	+ 0.8	+ 0.5
Vegetable oils	- 2.7	- 1.0	- 5.2
Grains	- 1.1	+ 4.6	- 4.0
Fruits, fresh	+ 3.5	+ 3.7	+ 3.1
Fruits, dried	+ 2.4	-	- 9.0
Non-ferrous metal products group	- 0.9	- 0.5	- 5.2
Silver	- 11.5	+ 0.9	- 21.7
Copper, refined (export prices)	- 0.9	- 0.5	- 10.2
Tin	+ 1.5	- 1.0	- 3.1
Chemical products group	- 0.5	- 0.1	+ 6.2
Fertilizer materials	- 11.0	-	- 6.6
Soaps and detergents	+ 3.6	- 0.3	+ 0.3
Organic chemicals	+ 1.6	- 1.0	+ 1.9
Wood products group	- 0.4	+ 0.8	+ 7.5
Building board	- 4.0	- 1.8	+ 2.9
Cedar	- 2.9	+ 6.4	+ 19.8
Spruce	- 1.7	- 0.5	+ 32.3
Pine	- 1.3	- 0.7	+ 5.6
Animal products group	+ 0.8	- 0.3	+ 2.9
Eggs	+ 4.1	- 0.6	- 7.5
Hides and skins	+ 3.8	- 1.7	- 2.5
Milk and its products	+ 3.5	+ 0.2	+ 10.6
Meats, cured	+ 1.8	- 3.2	- 12.5
Livestock	- 1.2	- 0.4	+ 1.5

Thirty Industrial Materials Price Index (1935-39=100)

The price index of thirty industrial materials, calculated as an unweighted geometric average, moved down 0.1% to 267.1 in September from the August index of 267.4. Prices were lower for eight commodities, higher for eight and unchanged for fourteen. Principal changes included decreases for linseed oil, raw sugar, oats, hogs, spruce lumber, steers and sisal, while increases were recorded for beef hides, structural shapes, raw cotton, cottonseed oil, raw rubber and tin.

Canadian Farm Products Price Index (1935-39=100)

The price index of Canadian farm products at terminal markets declined 1.1% to 261.7 in September from the August index of 264.6. A decrease of 4.5% to 169.2 from 177.2 in the field products index reflected lower prices for rye on both Eastern and Western markets, for potatoes, corn, oats and barley in the East, and for flax and hay in the West. Higher prices were shown for potatoes in the West. The animal products index advanced 0.6% to 354.1 from 352.0 on higher prices for eggs, cheese-milk, raw wool, butterfat and fluid milk on both Eastern and Western markets and for hogs in the West. Lower prices were shown for lambs and calves on both markets, and for hogs and steers in the East.

CONSUMER PRICE MOVEMENTS

SEPTEMBER 1971

The Consumer Price Index for Canada (1961=100) declined 0.2% to 134.7 in September from 135.0 in August. This decline, which matched the movement between these two months in 1969 and 1970, brought the index to a level 3.5% above that of September 1970. The latest month's decline was entirely attributable to a drop of 1.6% in the Food index. All other major components registered increases except Tobacco and Alcohol which was unchanged. The Clothing index rose 0.6% and Transportation advanced 0.2%, while the Housing, the Health and Personal Care, and the Recreation and Reading indexes each edged up 0.1%.

The Food index decreased 1.6% to 133.7 in September from 135.9 in August, which compares with a 1.4% decrease between these two months a year earlier, and an average decline over the corresponding period in the last five years of 1.2%. In the latest month, the component for food consumed at home moved down 1.9% while restaurant meal prices edged up 0.1%. The major contributors to the decline in the index of food for home consumption were vegetables and fruits which decreased seasonally in price, by 14.9% and 8.0%, respectively. Most fresh vegetables and fruits surveyed registered lower prices with the largest decreases recorded for tomatoes, carrots, potatoes, celery, corn, cabbages, grapes, peaches, apples and bananas. Bakery product prices dipped mainly because of 0.8% lower price level for bread which was on special in some cities. Reduced prices were also registered for ground coffee (5.1%), corn flakes (1.5%), salad dressing (1.3%), jam (1.2%), peanut butter (1.0%), sugar (0.3%) and margarine (0.3%). On the other hand, butter prices increased 3.9% in the latest month to a level 5.4% above that of a year earlier. The price level of other dairy products advanced 1.3% in the latest month as fresh milk rose 1.1% with increases recorded in Ontario, Alberta and Saskatchewan. Widespread price increases were registered for cheddar and processed cheese and for powdered skim milk. Egg prices advanced 9.8% in the latest month, but were still at a level 5.1% below that of a year earlier. The meat, fish and poultry index rose 0.3% between August and September 1971, mainly as a result of a 3.1% advance in pork prices which brought the pork index to a level 9.9% below that of September 1970. However, beef prices declined 0.9% in the latest month, to a level 3.7% above that of twelve months previous. Further, chicken prices rose 0.6% in the latest month to a level 16.4% above that of September 1970. In the twelve months to September 1971, the Food index increased 2.8%.

The Housing index edged up 0.1% to 137.7 in September from 137.5 in August as rises of 0.1% and 0.2%, respectively, were recorded for the shelter and household operation components. Within shelter both the rent and homeownership indexes moved up 0.1%. The homeownership rise reflected increases in dwelling insurance (2.3%) together with higher new house prices (0.6%) and homeowner repair charges (0.3%); partially offsetting these rises were decreases in property taxes in a few cities. Among household operation items, fuel oil prices rose 0.5% with increases recorded in Hull, Ottawa, Kingston, Sudbury, Sault Ste. Marie and Thunder Bay; a 0.1% rise in the electricity index was attributable to increased rates in Sault Ste. Marie. Furniture prices advanced 0.6% as higher prices for bedroom suites (2.3%), kitchen sets (1.1%), and dinette sets (0.9%) outweighed reduced prices for living room suites (0.9%) and mattresses (1.7%). The appliance index rose 0.3% with increased prices for automatic washing machines (1.3%), electric stoves (1.2%), and refrigerators (0.7%) partially offset by 1.0% lower sewing machine prices. Increased prices for carpets and linoleum moved the floor coverings index up 0.6% while reductions for sheets reduced the household textiles index by 0.8%. Among the other housing items, higher rates for household effects insurance moved this index up 2.1%. Between September 1970 and September 1971, the Housing index advanced 4.5%.

The Clothing index increased 0.6% to 129.6 in September from 128.8 in August. The level of men's wear prices advanced 1.1% with higher quotations recorded for most items surveyed including suits, slacks, dress socks and hats. ~~unusually~~ increased quotations for ladies wear items, also, resulted in a 0.8% advance in the women's wear index, with higher prices for rayon dresses, undergarments and sweaters leading the advance. The children's wear price level rose 0.4%, while that for piece goods moved up 0.6% as sale prices in the preceding month were discontinued. Higher prices for men's and women's street shoes resulted in a 0.2% rise in the footwear index while the clothing services index edged up 0.1% as increased charges for shoe repairs and laundry outweighed reductions in the average price of dry cleaning. In the twelve months to September 1971, the Clothing index rose 2.0%.

The Transportation index rose 0.2% to 131.0 in September from 130.7 in August. The local transit element increased 0.7% as higher fares were registered in Quebec City, Trois Rivières, Regina and Calgary. The automobile operation component edged up 0.1% as the price of gasoline remained unchanged and higher charges were recorded for a number of mechanical and body repair items, as well as for replacement parts such as tires and batteries. Partially offsetting these increases, train fares declined seasonally in the latest month. In September 1971, the Transportation index stood 4.5% above its level of September 1970.

The Health and Personal Care index went up 0.1% to 142.6 in September from 142.5 in August as a result of a 0.4% increase in personal care supplies prices. In particular, higher prices were recorded for toothpaste (1.2%), toilet soap (0.6%) and razor blades (0.4%). Between September 1970 and September 1971, the Health and Personal Care index increased 1.8%.

The Recreation and Reading index edged up 0.1% to 136.0 in September from 135.8 in August. The reading component advanced 1.9% because of some higher magazine subscription rates and a small increase in the level of newspaper prices. The recreation index declined 0.5% as a result of lower prices for radio and television sets which were partially attributable to a reduction in taxes on such home entertainment items. On the other hand, there were increases registered in television repair charges, phonograph record prices and admissions to football games in Hamilton. In the twelve months to September 1971, the Recreation and Reading index advanced 2.3%.

In September the Tobacco and Alcohol index remained unchanged from its August level of 129.6 and stood 2.5% above its level of September 1970.

Classified by goods and services, the total commodities index registered a decline of 0.5% between August and September which was mainly attributable to lower food prices. Non-durable commodities, excluding food, advanced in price 0.4% reflecting increases for clothing, footwear, personal care supplies and fuel oil. The price level for durable commodities declined 0.1% as lower prices for television and radio sets outweighed price advances for some automotive parts, appliances and furniture. A rise of 0.2% in the services index resulted from higher prices for automobile and television repairs, dwelling and household effects insurance as well as some advances in local bus fares and admissions to sporting events.

Security Price Indexes (1961=100)

The Investors Index of common stock prices rose 0.8% over August to 149.4 from 148.2. Indexes for the three major groups increased with industrials up 0.5% to 151.7, utilities up 0.5% to 146.5 and finance rising 2.9% to 144.9. Amongst the thirteen industrial sub-groups, increases in seven of the sub-groups ranged from 0.6% to 191.6 for beverages to 2.8% to 237.9, an all time high for petroleums. Decreases in the other six industrial sub-groups ranged from 0.4% to 248.1 for printing and publishing to 9.3% to 56.4 for construction, followed by an 8.0% decrease to 86.0 in chemicals. In utilities, with the exception of pipelines which edged 1.0% to an all time high of 170.5, all sub-groups registered decreases of under four per cent, ranging from 3.2% to 255.2 for transportation to 0.4% to 217.9 for gas distribution. In finance, both banks and investment and loan edged up 3.2% and 2.3% to 169.6 and 106.8 respectively.

In the same period, the index of Mining stock prices dropped 3.4% to 103.5, as Golds declined 5.9% to 95.3 and Base Metals fell 2.1% to 108.9.

Of the two supplementary price indexes, Uraniums fell 0.9% to 142.7 while Primary Oils and Gas rose 0.2% to 481.8.

The Preferred stock index edged 0.1% to 69.0.

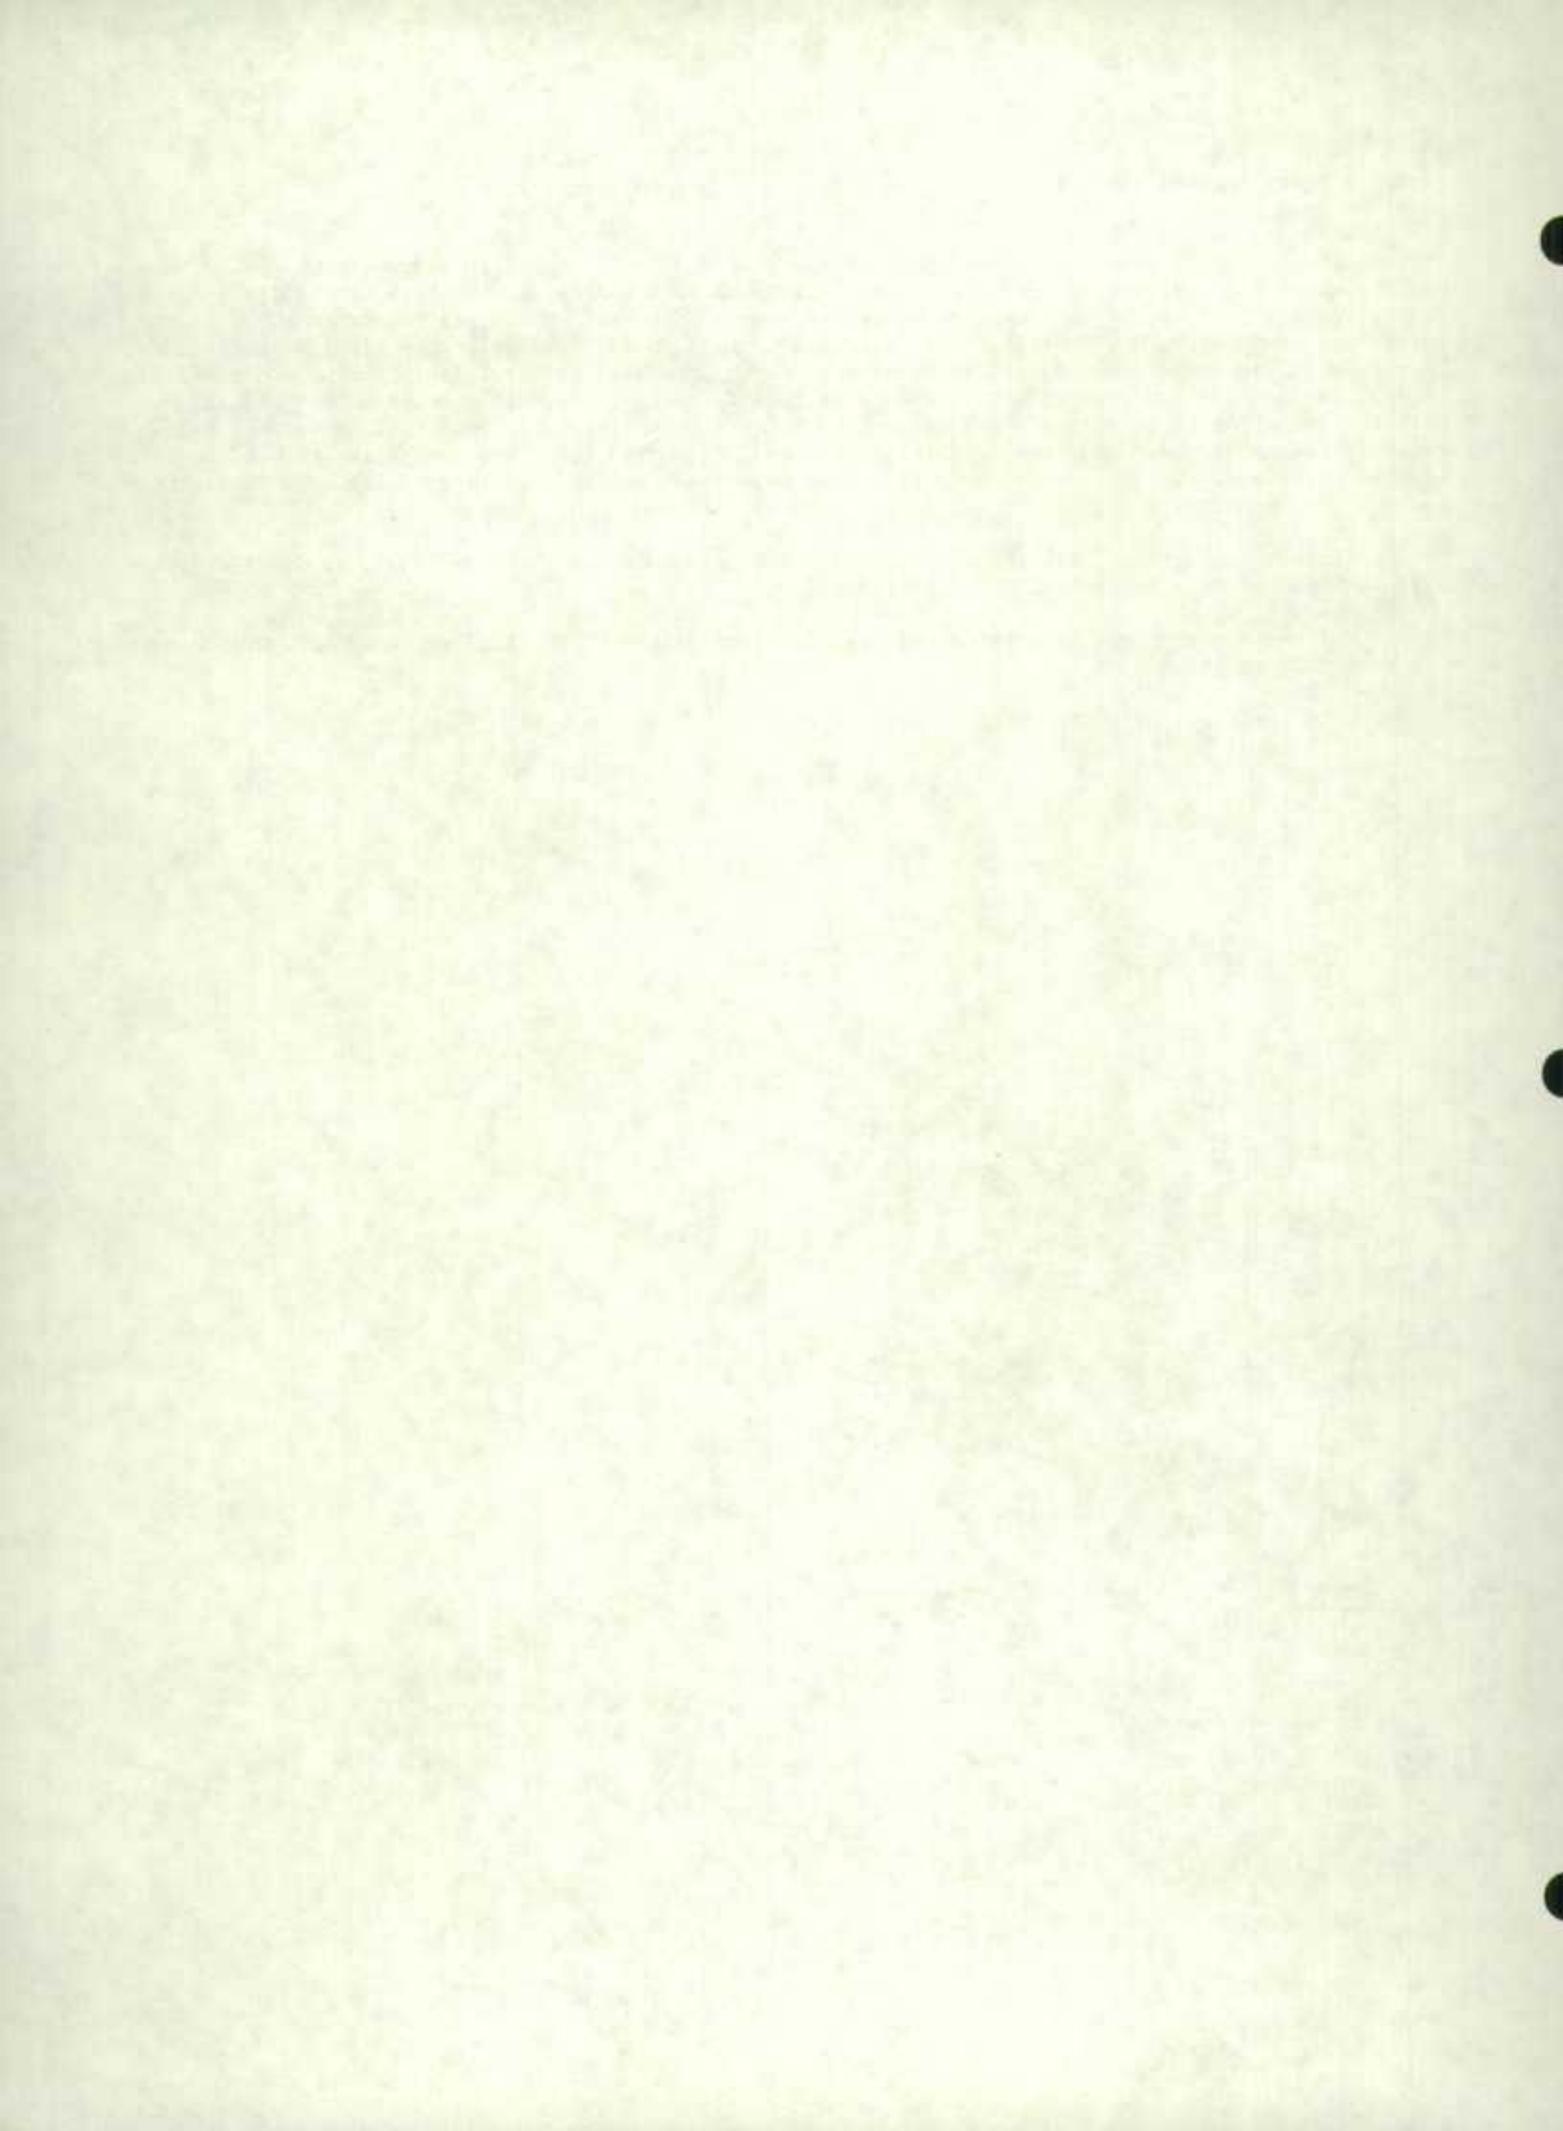

TABLE 1. Summary of Current Price Indexes

(1) Consists of General Wholesale Index less Animal products and Vegetable products component groups (see preceding page).
 (2) Consists of Iron products, and Non-ferrous metals products component groups less gold (see preceding page). (3) These two series comprise the General Wholesale Index. (4) Excludes golds. (5) Indexes for 1971 are subject to revision.

TABLE 3. Selected Price Indicators - Concluded

(1) Final to July 1970. See page 74 for details on Western grain prices and specific publications wherein final indexes for earlier years may be found.

(2) Indexes for 1971 are subject to revision.

TABLE 4. Wholesale Price Indexes of Selected Primary Commodities(1)
(1935-39=100)

Primary commodities	Months				Annual averages		
	Sept. 1971	Aug. 1971	Sept. 1970	Aug. 1970	1970	1969	1968
Asbestos, crude	429.7	429.7	411.6	411.6	411.6	399.7	377.6
Beans, cocoa	618.0	615.9	805.9	810.1	752.7	1,032.8	788.2
Beans, coffee	301.7	302.8	389.5	390.8	391.7	302.6	285.0
Coal	210.3	210.3	210.3	210.3	210.3	210.3	208.8
Copper, electrolytic	501.1	501.1	550.1	550.1	541.6	483.6	447.5
Cotton, raw	296.8	294.3	282.1	281.4	282.0	276.3	308.2
Eggs	125.0	120.1	135.1	135.9	139.6	161.7	143.0
Fruits, fresh	232.6	224.7	225.5	217.4	229.6	225.8	257.1
Grains	187.4	189.4	195.2	186.6	193.7	200.4	210.2
Hides and skins	149.2	143.7	153.1	155.7	171.4	185.6	159.4
Lead, electrolytic	283.0	283.0	324.9	324.9	331.0	318.8	281.2
Livestock	384.6	389.4	378.8	380.3	396.2	400.3	354.8
Nickel	474.1	474.1	474.1	474.1	474.8	390.6	351.7
Oil, crude	194.8	195.3	195.7	191.0	191.6
Onions	233.4	329.3	167.9	191.5	261.6	221.9	276.2
Potatoes	164.9	235.3	187.3	310.2	247.2	170.5	184.3
Rubber, raw	114.8	114.2	124.3	125.5	140.8	179.3	137.2
Scrap iron and steel	272.5	277.7	328.2	326.0	328.9	250.0	252.7
Silver	368.5	416.5	470.8	466.7	478.1	497.5	602.8
Steers	544.9	549.3	498.8	500.7	510.8	496.6	453.5
Sugar, raw	160.7	170.5	164.6	163.4	160.9	144.1	102.4
Tin	325.6	320.9	335.9	339.3	349.6	338.0	305.8
Wool, raw domestic	140.5	136.4	151.7	154.2	152.4	169.1	156.4
Wool, raw, imported	134.4	134.4	144.6	149.9	149.3	163.0	158.8
Zinc, prime, western	378.0	378.0	333.6	344.7	341.0	326.1	300.2

(1) Indexes for 1971 are subject to revision.

(2) Excludes fuel and lighting.

TABLE 14. Farm Input Price Indexes

(1961=100)

Beginning with the October 1971 issue of Prices and Price Indexes, Farm Input Price Indexes, 1961=100, for Eastern, Western, and all Canada, will be published quarterly and annually, in Table 14. These price indexes, from 1961 to the third quarter 1971, are contained herein (Table 2, page xx).

The Farm Input Price Indexes replaces one of the two major component indexes of the previously published series, Price Index Numbers of Commodities and Services Used by Farmers, 1935-39=100. The latter was composed of a Farm Family Living Index and a Composite Index Exclusive of Living Component. The new price indexes replaces the Composite Index Exclusive of Living Component from 1961 forward. The Farm Family Living component of the 1935-39 series has not been replaced by an updated counterpart, and publication has been suspended.

TABLE 15. Dealers Average Selling Prices for Feed, Canada and Five Geographical Areas
First of the Month Prices - Dollars per cwt

Item	Canada			Maritimes			Quebec		
	Sept. 1971	Aug. 1971	Sept. 1970	Sept. 1971	Aug. 1971	Sept. 1970	Sept. 1971	Aug. 1971	Sept. 1970

(3) Weights used to combine wage rate series: (Source: Dept. of Labour):

Labourer	46
Carpenter	30
Painter	7
Electrician	5
Plumber	5
Bricklayer and Mason	3
Sheet Metal Worker	2
Truck Driver	2
Total	100

(4) Materials weighted 62.5, wage rates 37.5.

(5) Materials weighted 65.0, wage rates 35.0.

(6 & 7) National Income and Expenditure Accounts, Catalogue 13-001, quarterly.

(7) This series contains an engineering component as well as a building component, and is therefore not precisely comparable in coverage with the non-residential composite index. The implicit price indexes are adjusted for changes in contractors profit and productivity.

(8) The indexes as originally published utilized the weights given above in the preparation of the fixed-weighted composite indexes. Because of the arithmetic rebasing of the indexes to the 1961=100 base, users can no longer apply the published weights to the indexes in columns 1, 2 & 3 and obtain the indexes given in columns 4 & 5.

* For further detailed explanation see Prices and Price Indexes - May 1970.

Explanation of Methods Used and Additional Sources for Price Series

Industrial Price Indexes

Industry Selling Price Indexes (1961=100)

Industry selling price indexes are published for approximately 100 industries within manufacturing. Also published are approximately 425 commodity price indexes for the products of these industries. The Classification system is that of the 1960 standard industrial classification, thus permitting the joint use of price statistics with other data such as production and employment similarly classified.

The data upon which both the initial selection of commodities to be priced and responding firms are made are contained in the Census of Manufacturers, a series of annual surveys collecting statistics on shipments of commodities, employment and materials used. Prices are collected on the 15th of each month or the nearest transaction date for the commodity being priced; sales and excise taxes are excluded.

The industry classified price indexes are useful for analysis of price movements, for estimation of the constant dollar value of shipments, and for purposes of contract escalations.

A complete description of these indexes is contained in: Industry Selling Price Indexes 1956-68, Catalogue No. 62-528.

General Wholesale Index (1935-39=100)

The General Wholesale Index is a commodity classified index of prices. The index is "general" inasmuch as it incorporates a diverse selection of both primary and processed commodities. It is called "wholesale" because its ingredient prices relate to that broad and heterogeneous area of commodity distribution which excludes only retail trade. In fact, the term "wholesale" has more of a connotation of bulk trading than of any homogeneous level of distribution. Thus, though the index mainly includes prices of producers, it also covers transactions of "middle men" who trade in commodities of a type or in quantities characteristic of primary marketing functions.

Though general wholesale price indexes have been calculated by many countries for years there is no precise answer to the question of what such an index measures. This is so because the index cannot be associated with any adequately definable value aggregate. Unlike a consumer price index which can be identified with expenditures of household consumers, a general wholesale index covers a host of overlapping transactions sometimes involving the same ingredient in as many as three different stages of processing. Yet, conceptually, it is not a measure of the purchasing power of money because it omits significant areas of monetary transactions such as prices of land, labour, securities and services, except in so far as prices of these things are implicit in commodity prices. As a conventional summary figure, its use has tended towards a reference level against which to observe the behaviour of particular price groups such as farm products, industrial materials, building materials and the various other groupings for which indexes are published. And as an indicator of general business conditions it is usually included in the group which is regarded as approximately coincident with the business cycle. However, its main attribute now lies in its long historical continuity.

For further details about the General Wholesale Index please consult: Wholesale Price Indexes 1913-50 (Reference Paper No. 24) Prices and Price Indexes 1949-52 (Vol. 23) (Catalogue No. 62-501)

The Farm Input Price Indexes, 1961=100

The Farm Input Price Indexes measure, through time, changes in prices of commodities and services used in Canadian farming operations. Indexes are calculated quarterly for Eastern, Western and all Canada. Quarterly and annual indexes covering the period 1961 to the third quarter 1971, and a description of concepts and methods are contained herein, beginning on page iv. Publication of Farm Family Living Price Indexes has been suspended.

Canadian Farm Products Price Index (1935-39=100)

Wheat prices used in the index are buying prices of the Canadian Wheat Board for Nos. 1, 2 and 3 Manitoba Northern at Thunder Bay. Prices for western oats and barley are also supplied by the Wheat Board and quotations relating to No. 2 C.W., No. 3 C.W. and No. 1 Feed Oats and to Nos. 1 and 2 feed barley are included in the price index. Initial payments are first used in the index calculation and are revised as further payments are announced.

Final payments for the crop year August 1969 - July 1970 were announced on February 4, 1971 for oats and barley, and on June 17, 1971 for wheat.

Unit	Initial and total participation payments 1969-70 and 1970-71			
	August 1969 - July 1970		August 1970 - July 1971	
	Initial payment(1)	Total participation payment(2)	Initial payment(3)	Total participation payment(4)

(1) Used in original indexes from August 1969 to July 1970. (2) Incorporated retroactively in revised final indexes August 1969 to July 1970. (3) Used in indexes August 1970 to present. (4) Not yet announced by Wheat Board.

Residential and Non-Residential Building Construction Price Indexes

The fixed-weighted input price indexes of materials and wage rates for residential and non-residential building construction are being published here for the convenience of users (Table 20). A more complete description of the characteristics of the indexes appeared in the May 1970 issue of Prices and Price Indexes, and this explanation is available on request from the Prices Division, as is historical monthly data for the series.

Because the indexes measure the impact of price change on the materials and labour inputs to construction, and not the effects of changes in profit margins or productivity, there is thought to be an upward bias in these indexes as indicators of price change for the output of building construction, or buildings in place. Users are therefore warned to exercise caution in making use of the series, for this purpose. A comparison of these series with the implicit price deflators(1) providing an estimate of price change for the output of the industry, derived from the measurement of gross fixed capital formation in constant dollars, will provide some insight into the effects on the price movement of adjusting the fixed-weighted input indexes for changes in productivity and profit margins.

During the period from 1926-1966 a special sample of respondents supplied materials prices for the index. As of 1961 this sample has been replaced with prices from the ISPI system(2). The latter are published monthly in Table 2 of this publication.

The Construction wage rate series is based on wage rate material supplied by the Labour Standards Branch, Dept. of Labour, and relates to minimum wages paid on government contracts for construction in a variety of trades and cities.

Users are reminded that the indexes were arithmetically rebased to the year 1961=100 and therefore combining the components with the weights as shown will not provide the composite index provided. Users able to provide their own weights for the components can recombine the components to suit their particular needs.

Price Indexes of Machinery & Equipment

In response to the need of users wishing either to correct expenditure data of machinery and equipment for price change or to make comparison of commodity movement, a system of machinery and equipment indexes has been under development for a number of years. This is a system of industry indexes relating to types of equipment purchases made by establishments belonging to industries as defined by the 1960 Standard Industrial Classification.

The base-weighted indexes give an estimate of how much more, or less, it would cost today to purchase a group of machines specified for a particular base period.

The interim time base for the indexes is 1968=100 and most of the data from which weighting patterns were derived came from 1968 or nearby years. Such data were usually supplied by major purchasers.

Conceptually purchasers' prices should be utilized in such indexes but because of a number of practical problems, manufacturers' selling prices were usually used. Such prices were then corrected as relevant for duty, exchange and federal sales tax.

Foreign prices utilized in the index are either U.S. Bureau of Labour Statistics commodity indexes or Prices Division collections from manufacturers most of whom reside in the United States.

The first industry index was released mid-1971 and related to purchases by the construction industry. Indexes for other industries will be released from time to time as they become available. In the interim preliminary indexes for a number of other industries are available on request. Certain commodity indexes which exclude adjustments for exchange, duty and federal sales tax can also be provided on request.

Highway Construction Price Indexes (1961=100) (1)

The Price Indexes of Highway Construction in Canada express prices paid by provincial governments in contracts awarded for highway construction each year, as a percentage of prices paid in 1961. The arithmetic conversion of the indexes to a 1961 time base does not change their percentage movements as compared to the previously published indexes to a 1956=100 time base. Users are warned that an aggregation of the converted major group indexes with the published weights will not yield the published 1961=100 all items indexes. The conversion does not create this problem for a user wishing to reweight the converted major group indexes using weights appropriate to his own purpose.

Base-weighted indexes are published annually and measure, for the period 1956 to 1968, the effect of price change on the cost of specific programmes of highway construction in Canada represented by highway construction contracts of approximately \$50,000 or more awarded by specified provincial governments during the weight-base period. Weights of items in the index, representing the relative importance of units of construction in the year 1956 are held constant. Only the estimates of prices change from year to year, and the indexes thus measure the movement of prices through time. For a more complete statement of the problems of estimating price change for highway construction see pages vi & vii of the December 1967 issue of Prices and Price Indexes, Catalogue 62-002 and pages 9 & 10 of the reference paper Price Indexes of Highway Construction in Catalogue 62-520. The all-items index or its components are useful for planning and budgeting for highway construction programmes, in escalating or up-dating previously costed roadwork, in estimating replacement cost of previously completed roadwork, and as historical measurements of price trends in highway construction.

The indexes do not necessarily reflect the price movements of non-contract construction or maintenance work. The indexes are designed to measure price changes for a fixed programme of highway construction, in each of the seven provinces. Because price levels in the time base-period (1961) varied from province to province the indexes cannot be used to compare price differences between provinces, but only to compare differences in the rate at which prices are changing in the provinces.

Prices contained in the index are not for units of labour and materials as is usually the case in construction price indexes but rather for units of construction work put in place such as an acre of clearing, a cubic yard of earth excavation or a ton of bituminous hot-mix paving. In addition, the index contains prices of some materials, such as culvert pipe, usually supplied to the contractor by the highway departments. Prices of highway construction work are annual weighted averages of bid prices of units of construction in groups of contracts awarded, classified by price-determining characteristics of the contracts and the bid items such as volume of the bid item, type of contract and geographic location. Prices of material items of supply are prices paid by government departments to suppliers.

(1) The years refer to fiscal years. Thus 1968 refers to the period April 1, 1968 to March 31, 1969.

Price Indexes of Electric Utility Construction

In electric utility terms, the index is designed to provide an estimate of the impact of price change on the cost of materials, labour and equipment used in constructing and equipping electric utilities in a specified base period. The index provides an estimate of how much more, or less it would cost to reproduce the base-period programme of construction in another period, using the same construction technology as in the base period and assuming rates of profit and productivity in construction are the same in both periods.

As the market does not yield comparable selling prices for such unique transactions as, for example, the sale of a transmission line, it was not possible to produce an index of the prices of completed structures. Completed structure indexes would be appropriate for users wishing either to estimate reproduction costs or to deflate capital formation. For such uses the indexes introduced in this publication have specific shortcomings. Nonetheless, they may be helpful for such purposes provided the users understand the deficiencies. Thus the reader is asked to make particular note of Section III, of Occasional Paper Catalogue 62-526 Price Indexes of Electrical Utility Construction - The Necessity for Compromise and Section XI, (of the same paper) Uses and Limitations. In addition, because particular construction projects are unique, the aggregate indexes will not likely be appropriate to specific projects since they relate to an average mix of materials, labour and equipment derived from a variety of projects in a specific base period. Thus, if the component price indexes and their weights included in the aggregate index presented herein are inappropriate for a particular purpose the user should consider selecting appropriate component indexes from among those published herein. These indexes could then be combined into an aggregate index by utilizing weights derived from the projects or assets to be costed or deflated.

Prices used in the indexes are for the most part selling prices reported monthly by manufacturers for materials or equipment. The price reported is for units and terms of sale representative of the volume sales of the manufacturer. Where sales to electric utilities form a small share of the total sales of the manufacturer, the price reported may not adequately represent the price to the construction trade and others directly involved in constructing and equipping electric utility facilities. In such cases, prices charged other manufacturers or wholesalers have been included in the index. Federal sales tax changes are reflected in the index but no adjustments have been made for provincial tax changes. Until December 1964 wage rate data were supplied by the Federal Department of Labour and represented minimum hourly rates paid to construction workers in major cities employed on federal government contracts. In 1965 union basic wage rates reported by major utilities and some contractors were incorporated into the index. The sample selected provides an estimate of wage rate change for urban own account and contract electric utility construction. Some further improvements will be made to improve the coverage relating to rural non-union work for transmission lines.

Construction has been defined as new construction or major reconstruction for distribution systems, transmission lines and transformation or switching stations. Maintenance and operating costs are excluded. Cost data were supplied by major utilities, relating to own account and to contract construction erected during the last half of the 1950's. Weights were derived from these data which indicated the relative importance of the major inputs to the construction. The components of cost relating to distribution and transmission facilities encompass such items as poles, hardware, conductors, insulators, meters, distribution transformers and expenditures for labour, e.g. - linemen and groundmen. Costs relating to construction equipment such as trucks, and components of equipment operating costs such as tires, gasoline and repairs were also included. Transformation and switching stations encompass some of the items listed above but the most important elements of cost relate to transformers and switching equipment. Expenditures for land and rights-of-way have been excluded.

The term Canadian electric utility has been defined to include municipal as well as non-municipal utilities but the majority of the cost data tabulated was derived from the major nonmunicipal utilities. Manufacturers who produce electricity for their own use and who may also sell electricity have been excluded from the cost survey.

Price Indexes of Hydro-electric Generating Stations.

The following additional points may be of assistance to users of the hydro-electric generating stations index which was described in some detail in Statistics Canada Occasional Paper, Catalogue 62-533.

- (a) Wage rate data are derived from a variety of sources but mainly from the Canadian Construction Association surveys of union agreements and from Federal Pay Research Bureau studies of salaries paid professional, technical and clerical personnel. Basic wage rates, excluding fringe benefits, were used in index calculations.
- (b) Prices for ready-mix concrete and for earth and gravels in place have been utilized as replacements for input prices of labour, materials and equipment rental for concrete production and embankments in place.
- (c) Prices are included for some categories of expense not previously included in input price indexes for construction: interest during construction, overhead expense and the provision and operation of temporary camp accommodation.
- (d) Weighting patterns exclude expenditure for ancillary facilities for logging and navigation, permanent houses, etc.

Purchase Price Indexes of Secondary Metals (1969=100)

Ferrous and non-ferrous indexes are compiled from a series of input prices, inclusive of transportation and brokerage fees, submitted by a wide variety of purchasers from selected industries. Indexes for certain categories of metals cannot be published because of the confidentiality of the data under the Statistics Act.

Security Price Indexes

Security price indexes measure through time the effect of price change on the value of a portfolio of stocks bought and held by a hypothetical investor (as opposed to the more speculative trader). The portfolio represents stocks of Canadian companies listed on Toronto, Montreal and Canadian stock exchanges. The number of shares held for each issue is in proportion to the total number of shares outstanding. Prices in the common and mining stock indexes are Thursday's closing quotations as reported in the *Globe and Mail* and the *Montreal Gazette*. For preferred stocks, prices are monthly weighted averages of the daily closing prices in which weights are daily total sales. The price reference base for the indexes is the year 1956 which has been adopted as an interim base for recently developed DBS indexes. The indexes express prices as a percentage of prices in 1956 and arithmetically converted to the 1961=100 base.

Revised indexes on the base 1956=100 were first presented in the June 1962 issue of this publication. The most important change in the revision of the index, apart from the shift in the price reference base, is the classification of stocks according to the Standard Industrial Classification. In the continuing major group Industrials 4 sub-groups (Milling and Grains, Food and Allied Products, Machinery and Equipment, and Building Materials) have been replaced by 8 new sub-groups (Foods, Printing and Publishing, Primary Metals, Metal Fabricating, Non-Metallic Minerals, Chemicals, Construction and Retail Trade). The remaining 5 sub-groups of the former index, viz., Industrial Mines, Beverages, Textile and Clothing, Pulp and Paper, and Oils (renamed Petroleum) have been continued. The major group Utilities is continued but the Pipelines index has been added as a sub-group and the previous Power and Traction sub-group has been replaced by two new sub-groups, viz., Electric Power and Gas Distribution. A new major group Finance is composed of the former major group Banks and the former supplementary index Investment and Loan. Constant weights, which were previously limited to major groups, have been extended to sub-groups. Weights in the index continue to be based on shares outstanding.

For the list of stocks currently included in the Investors Index and Preferred Index, see Prices and Price Indexes for February 1971.

Retail Price Indexes

Consumer Price Index for Canada (1961=100)

The Consumer Price Index measures the percentage change through time in the cost of purchasing a constant "basket" of goods and services representing the purchases by a particular population group in a specified time period. The "basket" is an unchanging or equivalent quantity and quality of goods and services of items for which there is a continually measurable market price over time, corresponding to a specific quantity of the item.

The index relates to a broad but specific group of urban families and reflects the price changes experienced by that "target group". The index is unlikely to represent closely the experience of any one family within the group nor should it be expected to reflect price change for other population groups for which income, family size and place of residence are characteristically different. The target group to which the current index relates is composed of families - (a) living in cities with over 30,000 population, (b) ranging in size from two adults to two adults with four children, and (c) with annual incomes during 1957 ranging from \$2,500 to \$7,000. To measure the influences of price change on the cost of goods and services purchased by such families, the Consumer Price Index reflects movements of some 300 items.

The history of consumer price indexes in Canada extends back to the early 1900's and encompasses periodic revisions of index base reference periods and weighting patterns. In 1952, the time base was updated to 1949=100 from 1935-39=100 and, at the same time, weights were revised to reflect family expenditure patterns in 1947-48. A subsequent revision of weights based on 1957 expenditures was introduced at the beginning of 1961 and the time base was revised from 1949=100 to 1961=100 at the beginning of 1969.

Full details on the latest weighting patterns and time base revisions are available in the occasional paper "The Consumer Price Index for Canada (1949=100) - Revision based on 1957 Expenditures", Catalogue 62-518 and in the January, 1969 issue of the monthly bulletin, *Prices and Price Indexes*, Catalogue 62-002.

Consumer Price Indexes for Regional Cities (1961=100)

Consumer Price Indexes for Regional Cities are published monthly in this bulletin (Table 11). The regional indexes are similar in concept and item coverage to the Consumer Price Index for Canada except for their individual weighting systems.

Each index is designed to measure the influence of changes in retail prices taking place in the localities specified, upon the cost of a fixed basket of goods and services representing the level of consumption of a representative group of families in those particular areas.

In using the city indexes, it should be remembered that they are not indicators of comparative levels of prices as between the cities. That is, they do not in any way indicate whether prices are higher or lower in one city than in another.

For comparisons of retail price differentials between cities see Table 13 of this publication and the relevant explanatory note on page 80.

Historical Consumer Price Indexes (1969=100) for Thunder Bay and Quebec City are available with explanatory notes, on request, from Retail Prices Section, Prices Division, Statistics Canada.

Measuring the Purchasing Power of Earnings

Changing consumer price levels affect the amounts of goods and services which a dollar will buy, and average earnings, of course, will be affected in the same way. An earnings measurement which takes the change of consumer prices into account, can be calculated by reducing actual earnings averages by the percentage amounts consumer price levels rise, or increasing them by the amount price levels fall. The adjusted averages may be used to indicate the comparative quantities of goods and services which could be purchased by average earnings if consumer price levels and consumption patterns had remained constant. The following illustration shows how this kind of an adjustment can be made.

Suppose that a series of average weekly wages rises from \$80.00 in week A to \$100.00 in week B, and that in the same interval a consumer price index advances from 100.00 to 110.0. Because of the 10 per cent rise in consumer prices, \$1.00 will not buy as much in week B as it would in week A. Likewise, a 25 per cent rise from \$80.00 to \$100.00 will overstate the increase which has occurred in the purchasing power of average weekly wages. This overstatement can be removed by reducing the figure of \$100.00 by the amount of the consumer price increase. The adjusted average is \$90.91 ($100.00/110.0 \times 100.0$), which may be referred to as a weekly wage average for week B expressed in the dollars of period A, or it may be said to indicate the level of real weekly wages relative to week A.

The foregoing calculation can be carried a step further to express in index number form the relationship between the week A average of \$80.00 and the week B figure of \$90.91. Taking the week A average of \$80.00 as equal to 100.0, the week B index becomes 113.6 ($90.91/80.00 \times 100.0$). Such an index may be called an index of weekly real wages. It indicates that average wages for week B will buy 13.6 per cent more goods and services than those received in week A, in spite of a 10 per cent rise in consumer prices. This 13.6 per cent increase in real wages compares with the rise of 25 per cent in money wages ($100.00/80.00 \times 100.0$).

It should be noted that while the estimates of average real wages may reflect the experiences of broad groups of workers fairly well, their applicability to individual wage-earners depends upon a number of considerations. For example, individual earnings will differ significantly from the group average, depending upon occupation, industry, geographical location, or sex of the wage-earner. Moreover, individual spending habits differ widely, but the consumer price index which is used to adjust the earnings data refers only to the average consumption pattern of a particular income group. Group-spending patterns change over periods of time. To the extent that this occurs, the earnings data adjusted by the consumer price index (which has a "fixed" consumption pattern), will gradually be rendered less valid. Finally, some part of income may be saved, and it should be borne in mind that it is not appropriate to reduce savings to a constant dollar basis by using index which reflects consumption patterns.

- 80 -

It should also be kept in mind that measures of change in real earnings calculated from averages of gross earnings may differ from changes in the purchasing power of "take-home" pay, due to such factors as changes in personal income tax, pay deductions for such things as social insurance and pension plans. Thus index numbers of real wages should not be interpreted as measuring fluctuations in the levels of consumption of wage-earners or wage-earners' families; they are intended to show only the trend in purchasing power of wages over the items covered by the price index, and in addition to the factors already mentioned, do not take into account other family income (including family allowances) or changes in the savings position of families.

The table in this report showing indexes of both actual and real wages uses 1961 as a reference year. However, the adjustment made in the foregoing illustration can be applied to any reference level; percentage change between any two periods will be the same regardless of the reference period selected.

Indexes of Retail Price Differentials

Statistics previously published relating to differences in retail prices between Canadian cities had been limited to indexes measuring comparative food price levels. Table 13 summarizes the results of a detailed revision of earlier urban place-to-place food indexes and expands the scope of spatial retail price measurements to take in other elements of the family budget. A fuller explanation of the study from which this table is derived, including more details of these inter-city price comparisons, are contained in the November 1968 and November 1969 issues of Prices and Price Indexes (Catalogue 62-002). In all, inter-city price comparisons were drawn for commodities and services comprising nearly three-quarters of the budget of which the Consumer Price Index for Canada is currently based. Major omissions are shelter (both rented and owned), domestic utilities (fuel, light and water), and restaurant meals. While recognizing the importance of shelter differentials in any overall comparison of the general price level being encountered by consumers in different urban centres, the problems inherent in drawing valid comparisons between cities are such as to require a good deal more research. Meanwhile, it is considered that, despite the absence of shelter differentials at this time, publication of retail price comparisons for other elements of the budget will go some distance towards serving the varied needs of users.

The original data base of this study was the wide range of retail price quotations collected in the course of production of the national and urban Consumer Price Indexes. In developing these spatial price comparisons efforts were made to achieve comparability by equating qualities of goods and services and by matching types of retail outlets, as far as possible. Price relationships between pairs of cities were derived and subsequently converted to a common base of Winnipeg prices equaling 100 to facilitate comparisons over the whole range of cities. The up-dating of these measurements of inter-city retail price differentials was accomplished by application of the relative movement of prices, at the item level in each city, over the intervening period as derived from the relevant city consumer price indexes. These price relationships at the item level were aggregated on the basis of the Canada urban consumer spending pattern, rather than the patterns applicable to individual cities. While differences in spending patterns exist among cities, the magnitude of these differences in the cities covered is not such as to affect most of the spatial comparisons significantly. Because of the previously mentioned absence of shelter price relationships, which may be of considerable significance in any overall comparison of inter-urban retail price differentials, aggregative indexes beyond major budget groupings are not shown.

It should be noted that the retail prices used in this comparison, being those faced by consumers, include sales and excise taxes as applicable. Variations between provinces in the scale of sales taxes imposed on a wide range of non-food commodities can be of significance in explaining inter-city price differentials for these items.

While these indexes have been expressed in terms of Winnipeg = 100, the selection of Winnipeg as the base city has no special significance, and the indexes may be expressed on the base of any of the individual cities included.
