Angus McMorran

## HOUSIMG BULHETIN NO. 11

The mamber of dwelling units completed in Canada in the first eleven month of 1948 is estimated at 68,103 . During November, 9,701 unite vere completed, the highest total for any month so far in 1948. It is expected thet the total for December will be even higher.

In November, 7,795 units were started and the number under construction at Nove ber 30, 1948, was reduced to 61,093 units.

The average length of time required to build the dwelling units completed in November was 6.0 months. This is no significant change from the October estimate of 6.1 monthe and oniy a slight increase over the low of 5.4 monthe reached in September.

It is estimated from the types of dwelling units being constructed that
$25 \%$ of those completed in the f1rst eleven months of 1948 are for rental purposes and that the remainder will be owner-occupled.

These estimates, as vell as other statistics contained in this bulletin, are the reaulta of a nation-wide survey carried out each month by the Dominion Bureau of Statiatics whth the cooperation of the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 5,000 or more are enumerated completely. Approximately 400 sample areas lying outaide these muncipalities are also chosen for complete enumeration.

In some of the tables, there appears a column headed "adjustments". These adjustments can arise in various ways. For example, after a start on a dwelling has been made, construction may cease, or a structure when completed may contain more or less dwelling units than were reported when construction commenced.

Appenúix 1: Definftions
```

(a) Coverage

The count of dwellings which are started, completed and under construction includes only new residential construction intended for year-round occupency, This means that seasonal dwellings such as summer cottages, ekl shacks, etc., ere not counted. Furthermore, dwellines which are occupied, even if unfinished, are regurded as completed for the purposes of this survey.

## (b) Type of dwelling

The definitions which apply to the different types of dwelling are as

## follows:

(1) 1-family detached: a one-family house onen on all four sider, 1.e., not joined to other buildinge;
(11) 2-femily detached: a two-femily house which contains only two dvelline unlts, either one ebove the other open on all four oldes, or two units side by side each open on three sldes, sometimes known as a semi-deteched house;
(1ii) sow or terrace: a one-femily or twe-femily house in a row of three or more attached houses with common or adjacert walle;
(Iv) apartment or flat: an apertment or flet is $(a)$ a residential structure conteinine three or more dwellinf, units, or (i) a structure used for bustness purposes which conteing one or more dueling units ieogn, living querters in an office bulluithe of fectory, liviag quarters over a store, etc.): and
(v) other: any type of dvellinp, which does not fall into one of the above clessiflcations.
ic) For the purpose of this survey, a dwelling unit is defined as the living quarters occupled by one household or family. The number of dwelifing units in a etructure will be the number of households the atructure is intended to accommodate.
(d) For the purpose of this survey, a farm must contain at leest one acre and mast yield agricultural produce valued at $\$ 50$ or more per year.

## Appendix 2: Reliability of the estimates

Since the estimates in this report are partially based an a sample survey, they are subject to sampling variability. This sampling variability 18 not present in the data on the manicipalities of 5,000 and over. When the estimates include an element derived from the sample survey, the sampling error increases as the size of the estimate decreafer. Care should be teken, therefore, in interpreting the precision of some of the estimates. The estimate of unilnished dwellings for the whole of Canada sheuld be within 5 percent of the figure which would have beer obtained from a complete count.

The estimates presented in the tables are shown to the last digit instead of being rounded, not because they are assumed to be accurate to the last digit, but rather for convenience in summation and economy in processing the tabulations.

In addition to sampling variation, all the estimates are subject to errors of eaumeration. However, these should be very small as the survey for the most part can be carried on without interview with a consequent elimination $\operatorname{col}$ all types of respondent error. \& complete count by the same enumerators would contain the same enumerative error.

## Appendix 3 : Metropolitan areas

Some cities in Canade have reasonably well-delined suburben areas which, for the purposes of the survey of starts and completions of dwelling units, have been included under the name of the principal city. A list of the municipelities included in these metropolitan areas was given in Housing Bulletin No. 1. pp. 13-15.
