## HOUSING BULLETIN NO. 4

The number of dwelling units completed in Caneda in the first five monthe of 1948 is estimated at 24,582 with 6,284 of the se being completed during the month of May. During the same five months construction was commenced on an estimated total of 26,359 dwelling units. Complete data for 1947 are not avallable. However, estimates of residential consiruction in 194, have been made and, based on the estimates, completions in the first five months of 1948 amount to only slightly more than in 1947 while starts are about $15 \%$ higher. The following chart now the completions in the first five monthe of 1948 compared with the completions in 1947.

The average lengti of time required to build the dwelling units completed in May was about 7.2 month and most of the dwellings being completed
were started last year. It will not be until the fall that completions wil reflect the high level of starts which has been maintained for the last two months.

It is estimated from the types of dwellings being constracted that 3 C of the dwellings units completed in the five months of 1948 are for rental purposer while the remainder will be owner occupied.

The distribution between urban constraction (inciuding all of the metropolitan areas) and rural construction is shown for each region on the following chart.

These estimates, as well as other statistics contained in this bulletin, are the results of a nation-wide survey carried out each month by the Dominion Bureau of Statistics with the cooperation of the Central Mortgage and Housing Corporation. All metropolitan areas and uroan centres with a population of 5,000 or more are enumerated completely. Approximately 400 sample areas lying outside these municipalities are also chosen for complete enumeration.

In some of the tables, there appars a column headed "adjustments". These adjustments can arlse in various ways. For example, after a start on a dwelling has been made, construction may cease, or a structure when completed may contain more or less dwelling units then were reported when construction commenced.

## Appendix 1 : Definition:

## (a) Coverage

The count of dwellings which are started, completed and under construction includes only new residential construction intended for yeer-round occupancy. This means that seasonal dwellings such as sumaer cottages, ski shacke, etc., are not counted. Furthermore, dwellings which are occupied, even if unfinished, are regarded as completed for the purposes of this survey.
(b) Type of dwelling

The definitions which apply to the different types of dwelling are as follows:
(1) 1-family detached: a one-family house open on all four sides, i.s., not joined to other buildings;
(11) 2-family detached: a two-family house which contains only two dwelling units, either one above the other open on all four sides, or two units side by side each open on three sides, sometimes known as a semi-detached house;
(1ii) row or terrace: a one-family or two-family house in a row of three or more attached houses with common or adjacent walls;
(iv) apartment or flat: an apartment or flat is (a) a residential structure containing three or more dwelling units, or (b) a structure used for business purposes which contains one or more duelling units (e.go, living quarters in an office building or factory, living quarters over a store, etc.): and
(v) other: any type of dwelling which does not fall into one of the above classifications.
(c) Dwelling unit

For the purpose of this survey, a dwelling unit is defined as the living quarters occupied by one household or family. The number of dwelling units in a structure will be the number of houscholds the structure is intended te accommodate.
(d) Farm dwelling unit

For the purpose of this survey, a farm must contein at least one acre and must yield agricultural produce valued at $\$ 50$ or more per year.

## Appendix 2: Reliability of the estimates

Since the eatimates in this report are partially based on a sample survey, they are subject to sampling variability. This sampling variability is not present in the data on the municipelities of 5,000 and ver. When the estimates include an element derived from the sample survey, the sampling error incresses as the size of the estimate decreases. Care should be taken, therefore, in interpreting the precision of some of the estimates. The estimate of unfinished dwellings for the whole of Canada should be within 5 percent of the figure which weuld have been ebtained frem a complete count.

The estimates presented in the tables are shown to the last digit instead of being rounded, not because they are assumed to be accurate to the last digit, but rather for convenience in summation and economy in processing the tabulations.

In addition to sampling variation, all the estimates are subject to error of emumeration. However, these should be very small as the survey for the most part can be carried on without interview with a consequent elimination ol all types of respondent error. A complete count by the same enumerators would contain the same enumerative error.

## Appendix 3: Metropolitan areas

Some cities in Canada have reasonably well-defined suburban areas which, for the purposes of the survey of tarts and completion of dwelling units, have been included under the name of the principal city. A list of the municipalities included in these metropolitan areas was given in Housing Bulletin No. 1. pp. 13-15.
