## HOUSINO BOLLETIN HO. 6

The number of dwelling units completed in canada in the first seven monthe of 1948 is estimated at 36,601 . In each month since April, starts have exceeded completions and the number under construction has increased to 55,686 at July 31. During July, construction was commenced on 9,684 dwelling units, reduction from the high for the year of 13.409 recorded in June. On the other hand complations contimed at the rate of about 6,000 per month.

The average length of time required to complete a dwelling unit has fallen to 6.2 monthe for July completion. At this rate the completions in the next few month should reflect the large number of starts which have been made since the beginning of April.

It is estimated from the types of dwellings being constructed that $30 \%$ of the dvelling unite completed in the first 7 months of 1948 are for rental purposes. The remainder will be owner occupied.

NUMBER OF DWELLING UNITS COMPLETED
FIRST SEVEN MONTHS OF 1948

These estimates, as well as other etatistics contained in this bulletin, are the results of a nation-wide survey carried out each month by the Dominion Bureau of Statistics with the cooperation of the Ceatral Morteage and Housiag Corporation. All metropolitan areas and urban centres with a population of 5000 or more are emmerated completely. Approximately 400 sample areas lying outside the se municipalities are also chosen for complete onumeration.

In some of the tables, there appears a column headed "adjustments". These adjustments can arise in variour wayb. For example, after a start on a dwelling hes been made, construction may cease, or a structure when completed may contain more or less dwelling units then were reported when construction commenced.

## Appendix 1: Defialtions

(a) Coverage

The count of dwellinge which are started, completed and under construction includes only new resideatial constraction intended for year-round occupancy. This means that seasonal dwellinge such as summer cottages, ski shacks, otc., are not counted. Furthermore, dvellings which are occupied, even if unfialsbed, are regarded as completed for the purposes of this survey.
(b) Type of duelling

The definitions which apply to the different types of dwalling are as follows:
(1) 1-family detachedt a one-fanlly house open on all four sldes, i.e., not joined to other buildings:
(11) 2-fandly detached a tro-family houce which coataine only tro dwelling units, elther one above the other open on all four sides, or two units side by side each open on three sides, sometimes known as a semi-detached house;
row or terrace: a one-fanily or two-fanily house in a row of three or more attached houses with common or adjacent wallo:
(iv) apartment or flats an apartmeat or flat is (a) a resideatial structure containing three or more dwelling units, or (b) a structure used for businese purposes which contains one or more dvelling unita (e.g., living quarters in an office building of factory, living quarters over a store, etc.); and
(v) othert any type of dwelling which does not lall into one of the above classifications.
(c) Dreliling unit

For the purpese of this survey, a dwelling unit is defined as the living quarters occupied by one household or family. The number of dwelling units in a structure will be the aumber of housoholds the structure is intsnded te accommedate.
(d) Farm dwelling unit

For the purpese of this survey, a farm mest contain at least one acre and must yield agricultural produce valued at $\$ 50$ or more per year.

Appendix 2: Relievility of the estimates

Since the estimates in this report are partlally based on a sample survey, they are subject to sampling variability. This sampling variability is not present in the data on the municipalities of 5,000 and over. When the estimates include an element derived from the sample survey, the sampling errer increases as the size of the estimate decreases. Care should be taken, therefore, in interpreting the precision of some of the estimates. The estimate of unfinished dwellings for the whole of Canada should be within 5 percent of the figure which would have been -btained from a complete ceunt.

The estimates presented in the tables are shown to the last digit instead of being rounded, not because they are assumed to be accurate to the last digit, but rather for convenience in sumation and economy in processing the tabulations.

In addition to sampling variation, all the estimates are subject to errors of emueration. However, these should be very small as the survey for the most part can be carried on without interview with a consequent elimination af all types of respondent error. A complete count by the same cmumerators vould contain the same enumerative error.

## Appendix 3: Netropolitan areas

Some cities in Canade have reasonably vell-defined aburben areas which, for the purposes of the survey of starts and completions of dwelling units, have been included under the name of the principal city. A list of the municipalities included in these metropolitan areas was given in Housing Bulletin No. 1. pp. 13-15.
