## THE LABOUR FORCE SEPTEMBER, 1961

The Canadien labour force was estimated at $6,543,000$ in the week ended September 16, 19:1. This total included $6,235,000$ persons employed for all or part of the week and 308,000 persons unemployed for the whole week. Between August and September, there were decreases in the labour force of 161,000 , in the employed of 146,000 , and in the unemployed of 15,000 . The labour force was 69,000 higher than in September last year, the employed having increased by 88,000 over the year while the unemployed decreased by 19,000.

Of the total decrease in employment from August, 79,000 occurred in agriculture and

67,000 in nonagricultural industries. From September 1960, nonagricultural employment increased by 121,000 while the number employed in agriculture declined by 33,000 . Men accounted for all of the decrease in employment between August and September. The number of employed women was 54,000 higher than in September last year; over the year, employed men increased by 34,000.

Expressed as a percentage of the labour force, the unemployment rate was 4.7 in September, compared with rates of 4.8 in August this year and of 5.1 in September 1960.

Occupation and industry att.aciments of the individuals comprising the labour force are obtained in the Labour Force Survey. Current occupation and industry are reported for the employed. The unemployed are identified with the industry in which they last worked and with the occupation which they last followed. From these data, unemployment rates for occupation and industry groups may be calculated by expressing the number unemployed as a percentage of the labour force classified in each group. It is also useful to make distributions of the unemployed according to broad occupation and industry groups to establish what proportion of unemployment is associated with different occupations and industries. Unemployment rates and percentage distributions for the 3rd quarter of 1961, With comparative data for the lst and and quarters of 1961 and the last two quarters of 1960 , are shown in the following tables - in Table 1 by occupation group and in Table 2 by industry group.

Some of the more noteworthy features of these tables may be noted briefly:

1. Occupational unemployment rates for labourers and for construction and transportation ou-cupations were consistently atove national aver-
ages, while the rates for office and professional workers were substantislly lower. Industry unemployment rates were appreciably above national averages only for construction; unemployment rates for the trade and service industries were lower than the national averages throughout the yoar.
2. Seasonal movements in occupation and industry unemployment rates followed the general pattern of unemployment; rates generally were highest in the first quarter and lowest in the third. Occupationally, the greatest seasonal variations in unemployment rates occurred in the "Construction", "Labourers", "Transportation" and "Primary" groups. By industrys seasonal changes were most pronounced in the "Construction", "Primary", and "Transportation and other utilities" groups.
3. While unemployment rates for most industry and occupation groups in the third quarter were at about the same levels this year as last year, the rates for manufacturing and construction (both occupationally and industrially) were lower this year. From 1960 to 1961, the proportion of unemployment attributable to manufacturing and service occupations and to the marufacturing industry groun decreased.

(1) The unemployed in an occupation group as a percentage of the labour force in that occupation grcup.
(2) Includes managerial, professional, cominnication, conmercial, financial, and clerical occupations.
(3) Includes agricultural, IMslinge, trapping, logging, and mining occupations.
(4) Includes labourers and unskilled workers not agricultural, fishing, lopring, or mining.
(5) Comprises unemployed persons who never had a full-time civilian job lasting two weeks or more

The statistics contained in this report are based on information obtained through a sample survey of households. Interviews are carried out in about 35,000 households chosen by area sampling methods across the country. The Labour Force Survey, started in November 1945, was taken at quarterly intervals until November 1952. Since then it has been carried out monthly. Estimates of employment, unemployment and non-labour force activity refer to the speciflc week covered by the survey each month.

The sample used in the surveys of the labour force has been designed to cover all per
sons in the civilian noninstitutional population who are 14 years of age or over and who reside in Canada, with the exception of: members of the armed forces, inmates of institutions, residents of the Iukon and Northwest Territories and Indians on reservations. These excluded categories amount to about three per cent of the total population 14 years of age and over.

Estinates derived from a sample survey are subject to sampling and other kinds of error. Aspects of this subject in relation to the Labour Force Survey are reviewed under "Rellability of Estimates" on page 8.

Labour Force Statistics

Contents of the Tables - The results of the survey are presented in the tables on pages 4 to 7 of this report

Canada, Labour Force (pages 4 and 5). Tables 1 to 3 refer to the labour force, employment and unemployment and contain labour force participation and unemployment rates.

Canada, Employed (page 6). Tables 4
to 6 contain further detail on employment. Canada, Unemployed (page 7). Table 7
contains further detall on unemployment. Regions, Labour Force (page 7).
Table 8 contains labour force data for the regions.
Supplementary Dats - From time to time, additional dats on particular aspects of the labour force or its components will be obtained. Such material, as it becomes available, will be released through occasional supplements inserted in or attached to regular issues of this report.

Other Data Available - In addition to the published statistics, thers is a considerable amount of data which can be obtained on request. Following is a list of material available.

For Canada only:

1. Age and sex distributions.
2. Marital status and sex distributions.
3. Rimployed -
(a) Ressons for working less than full-time.
(b) Hours worked by sex for total employed, agriculture and non-agriculture, and for paid workers, non-agriculture.
(c) Industry and occupation groups, by sex for total employed and for paid workers. 4. Persons not in the labour force by category.

For regions:

1. Labour force -
(a) By age.
(b) Agriculture and non-agriculture by sex. 2. Employed by age.

## Definitions and Explanations

Labour Force - The civilian labour force is composed of that portion of the civilian noninstitutional population 14 years of age and over who, during the survey week, were employed or unemployed.

Employed - The employed includes all persons who, during the survey week:
(a) did any work for pay or proflt;
(b) did any work which contributed to the running of a farm or business operated by a related member of the household; or
(c) had a job, but were not at work, because of bad weather, illness, industrial dispute, or vacation, or because they were taking time off for other reasons.
Persons who had jobs but did not work during the survery week and who also looked for work are included in the unemployed as persons without work and seeking work.

Unemployed - The unemployed includes all persons who, through the survey weak:
(a) were without work and seeking work, i.e., did no work during the survey week and were looking for work; or would have been looking for work except that they were temporarily 111, were on indefinite or prolonged layoff, or belleved no suitable work was available in the commity; or
(b) were temporarily laid off for the full week, 1 . $\theta_{\text {g, }}$ were waiting to be called back to a job from which they had been laid off for less than 30 days.
Not in the Labour Force - Those not in the labour force include all civilians 14 years of age and over (exclusive of institutional population) who are not classified as employed or unemployed. This category includes those: going to school; keeping house; too old or otherwse unable to work; and voluntarily idle or retired. Housewives, students and others who worked parttime are classified as amployed. If they looked for work they are classified as unemployed.

(1) Formerly termed "Without jobs and seeking work".

Less than 10,000.

## Reliability of Estimates

## (a) Non-sampling Variability

The dsta obtained by emumeration, elther of the entire population or of a sample of it, will differ in some degree from the true data as outlined by the definitions because of enumerator and respondent variations. The amount of variance associated with these factors differs with the nsture of the inquiry. In general, the more personal and more subjective inquiries are subject to greater error.
(b) Sampling Variability

In addition to non-sampling error, mentioned in subsection (a), the survey resuits are subject to sampling variability. While for the non-sampling component of error statistical estimates of its magnitude are not available, estimates of the probable range of the sampling component of error have been calculatad. Estinates of the sampling variability for specified sizes of estimates in any month are given in the table in the next colunm.

The measure of sampling variablity as shown is twice the standard deviation; thus the odds are about 19 to 1 that the range (Labour Force Estimate $\pm$ Sampling Variability) contains the true estimates.

These estimates are averages since sampling variability differs from characteristic to charactoriatic and from month to month. In particular, for the unemployed and for persons working from 1 to 34 hours, the sampling variability is sbout 40 per cent higher than the general average and this higher variability is shown in the table also.

These estimates of sampling variability cannot be applied directly to estimates of month-ta-month change. However, etudies indicate that the sampling variability of a difference over a period of one montt can be approximated for the employed and for the unemployed using the following formula: ( 0.6 ) times (the square poot of the sum of the squares of the sampling variabilities associated with the two estimates).

For example, suppose the estimates of employed persons in June and July, were $6,139,000$ and $6,262,000$
respectively, with ampling variabilities of about 61,000 each. The difference between these two estimates (123,000) would have a sampling variability of approximately:

$$
0.6 \sqrt{61,000^{2}+61,000^{2}} \text { or about } 52,000
$$

For "the unemployed", suppose the corresponding estimates for June and July were 315,000 and 330,000 wath sampling varisbilities of about 28,000 . The difference between these two estimates ( 15,000 ) would have a sampling variability of approxinately:

$$
0.6 \sqrt{28,000^{2}+28,000^{2}} \text { or about } 24,000
$$

Estimated sampling variability for the najor labour force characteristics by size of estimate

| Size of estinste | General sampling variability |  | $\begin{gathered} \text { General sampling } \\ \text { variability } \\ +40 \%(1) \end{gathered}$ |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Size | Per cent | Size | Per cent |
| 10,000 | 3,500 | 35.0 | 5,000 | 50.0 |
| 25,000 | 5,500 | 22.0 | 7,500 | 30.0 |

(1) The unamployed in an industry group as a percentage of the labour force in that industry group.
(2) Includes agriculture, forestry, fishing and trspping, and mining.
(3) Includes transportstion, commnication, storage, and public utilities.
(4) Includes service and finance, insurance and real estate.
(5) Comprises unemployed persons who never had a full-time civilian job lasting two weeks or more.
