

# DOMINION BUREAU OF STATISTICS 

OTTAWA - CANADA
Published by Ãuthority of the Honourable George Mees, Minister of Trade and Commerce

Vol. 19 No. 8
SEP
23
1963

In the wek Y August 24, 1963, the Cahadi an labour force was estimated at 7,016,000. There were $6,746,000$ persons employed for all or part of the week and 270,000 persons unemployed for the whole week. There was relatively little change between July and August in either the total labour force or the number employed. Over the month, the unemployed decreased by 23,000. The labour force was 154,000 higher than in August 1962, the employed having increased by 164,000 and the unemployed having decreased slightly.

As with total employment, there was no appreciable change between July and August in

## THE LABOUR FORCE

## AUGUST 1963

Price: $\$ 2.00$ per year
agricultural or nonagricultural employment, nor in the numbers of men or wamen employed. Compared with August 1962, employment in nonagricultural industries was 187,000 higher and agricultural employment was 23,000 lower. Employment increased by 88,000 among men and by 76,000 among women over the year.

The unemployment rate was 3.8 per cent of the total labour force in August; the rate in July this year was 4.2 per cent, and in August 1962 the rate was 4.1 per cent. Seasonally adjusted, the unemployment rate in August 1963 was 5.6 per cent.

## The Unemployed: Family Dat: ${ }^{\text {( }}$ ()

## July 1962 - July 1963

Since July 1960, labour force data relating to families In which soneone was unemployed have been tabulated at quarteriy intervals and published several times a year. Since the most recent pubijcation in the Fobruary 1963 report, data referring to the weoks ended April 20 and July 20, 1963, have been compiled and are included in the following tables, along with previously pubished data for the weeks ended July 21, 1962, October 20, 1962, and January 19, 1963. Some comments on the latest f1gures - those for July 1963 - and on seasonal patterns follow.

There were 293,000 unemployed in July 1963, of whom 103,000 (35\%) were heads of family unite, 165,000 (56\%) were sons, daughters or other relatives of the family heads, and 25,000 ( $9 \%$ ) were not mambers of family units.

The 268,000 unemployed members of families were distributed through 245,000 family units. In about two-thirds of these units, at least one person was employed. Table 3 indicates that the probability of some member of the unit being employed is greatest in the larger fanilies.

Over the tawe rerse for whicin ata and ayalatie, strong seasonal patterns are evident. lotably, the prowntion of the unamployed who are heads of households has brest lowest in July, ranging between 35 and 39 per cent, and highest in January and April (48-51 per cent). On the other hand, the oercentage of tho unemployed who are eingle sons or daughters of heads of households has been highest in July ( $40-45$ per cent), when large nuabers of students would have recently entered the labour market; the seasonal low points have occurred in January and April (30-32 per cent). There are large seasonal vamations also in the proportion of family units having soneone employed (in addytion to the unomployed member) - from about one-hali in January and April to almost two-thirda in July and October.

Further detail for July 1963 is presented in the following tables, along with comparable estinates for the four preceding quarterly reference periods. Table 1 refers to unemployed persons. Tables 2 and 3 relate to farily units in which ore or more members were unemployed.

(1) The fanily unit used in these tables is deflned as "a group of two or more persons who are living together in the sale dwelling and who are related by blood, marriage or adoption". A person iiving alone or who is related to no one else in inf dwelling where he lives is classified under "Non-members of family units".

The head of a family unit is deflned generally as the person who is mainly responsible for the maintenance of the unit. However, in families consisting of husband and wife (with or without umarmed children), the husband is always designated wa the head. In famlies composed of parent and unmarried child (or children), the parert invariably is recorded as the head of the unit.
(2) Revised.
(continued on page 8)

## Technical Notes

Scope of Labour Force Survey

The statistics contained in this report are based on information obtained through a sample survey of households. Interviews are carried out in about 30,000 households chosen by area sampling methods across the country. The Labour Force Survey, started in Novenber 1945, was taken at quarterly intervals until November 1952. Since then it has been carried out monthly. Estimates of employment, unemployment and non-labour force activity refer to the speciflc week covered by the survey each month.

The sample used in the surveys of the labour force has been designed to cover all
persons in the civilian noninstitutional population who are 14 years of age or over and who reside in Canada, with the exception of: members of the armed forces, innates of institutions, residents of the Yukon and Northwest Territories and Indians on reservations. These excluded categories amount to about three per cent of the total population 14 years of age and over.

Estimates derived from a sample survey are subject to sampling and other kinds of error. Aspects of this subject in relation to the Labour Force Survey are reviewed under "Reliability of Estimates" on page 8.

Labour Force Statistics

Contents of the Tables - The results of the surver are presented in the tables on pages 4 to 7 of this report

Canada, Labour Force (pages 4 and 5). Tables I to 3 refer to the labour force, employment and unemployment and contain labour force participation and uneraployment rates.

Canada, Enployed (page 6). Tables 4
to 6 contain further detail on employment. Canada, Unemployed (page 7). Table 7 contains further detail on unemployment. Regions, Labour Force (page 7). Table 8 contains labour force data for the regions.
Supplementary Data - From time to time, additional data on particular aspects of the labour force or its components will be obtained. Such material, as it becomes available, will be released through occasional supplements inserted in or attached to regular issues of this report.

Other Data Available - In addition to the published statistics, there is a considerable amount of data which can be obtained on request. Following is a list of material available.

For Canada only:

1. Age and sex distributions.
2. Marital status and sex distributions.
3. Employed -
(a) Reasons for working less than full-time.
(b) Hours worked by sex for total amployed, agriculture and non-agriculture, and for paid workers, non-agriculture.
(c) Industry and occupation groups, by sex for total employed and for pald workers.
4. Persons not in the labour force by category.

For regions:

1. Labour force -
(a) By age.
(b) Agriculture and non-agriculture by seo. 2. Employed by age.

## Definitions and Explanations

Labour Force - The civilian labour force is composed of that portion of the civilian noninstitutional population 14 years of age and over who, during the reference week, were employed or unamployed.

Employed - The employed includes all persons who, during the reference week:
(a) did any work for pay or proflt;
(b) did any work which contributed to the running of a farm or business operated by a related member of the household; or
(c) had a job, but were not at work, because of bad weather, illness, industrial dispute, or vacation, or because they were taling time off for other reasons.
Persons who had jobs but did not work during the reference week and who also looked for work are included in the unemployed as persons without work and seeking work.

Unemployed - The unemployed includes all persons who, through the reference week:
(a) were without work and seeking work, i.e., did no work during the reference week and were looking for work; or would have been looking for work except that they were temporarily ill, were on indefinite or prolonged layoff, or believed no suitable work was available in the community; or
(b) were temporarily laid off for the full week, i.e., were waiting to be called back to a job from which they had been laid off for less than 30 days.

Not in the Labour Force - Those not in the labour force include all civilians 14 years of age and over (exclusive of institutionsl population) who are not classified as employed or unemployed. This category includes those: going to school; keeping house; too old or otherwise unable to work; and voluntarily idle or retired. Housewives, students and others who worked parttime are classified as employed. If they looked for work they are classified as unemployed.

Note: Effective with the October 1962 report, the figures in Table 5 will show Incustry estimates as an average for three successive months. In future, one-third, rather than all, of the records will be coded for Industry each month (a different third each month). The accuracy of the new 3 -month averages will, therefore, be comparable to the accuracy of the previously published monthly estimates.

## Reliability of Estimates

## (a) Non-sampling Variability

The data obtained by omumeration, efther of the antire population or of a sample of it, will differ in some degree from the true data as outlined by the definitions because of enumerator and respondent varistions. The amount of variance associated with these factors differs with the nature of the inquiry. In general, the more personal and more subjective inquifles are subject to greater error.

## (b) Sampling Variability

In addition to non-sampling orror, mentioned in subsaction (a), the survey results are subject to sampling variability. While for the non-sampling component of error atatistical estimates of its magnitude are not available, estimates of the probable range of the sampling component of error have been calculated. Estinates of the sampling va-1ability for specified sizes of estimates in ary month are given in the table in the next colum.

The measure of sampling variabllity as shown is twice the atandard deviation; thus the odds are about 19 to 1 that the range (Labour Force Estimate $\pm$ Sampling Variability) contains the true estimates.

These estimates are averages aince sampling varlability differs from characteristic to characteristic and from month to month. In particular, for the unemployed and for persons working from 1 to 34 hours, the sampling varlability is about 40 per cent higher than the general average and this higher variability is shown in the table also.

These estimates of sampling variability camot be applied directly to estimates of month-to-month change. However, studies indicate that the sampling variability of a difference over a period of one month can be approximated for the amployed and for the unemployed using the following formula: $(0.6)$ times (the square root of the sum of the squares of the sampling variabilities associated with the two estimates).

For example, suppose the estimates of employed persons in June and July, ware $6,139,000$ and $6,262,000$
respectively, with sampling variabilitiea of about 61,000 each. The difference between these two estimates ( 123,000 ) would have a sampling variability of approximately:

$$
0.6 \sqrt{61,000^{2}+61,000^{2}} \text { or about } 52,000
$$

For "the unemployed", suppose the corresponding estimates for June and July were 315,000 and 330,000 with sampling variabilities of about 28,000. The difference between these two estimates $(15,000)$ would have a sampling variability of approximately:

$$
0.6 \sqrt{28,000^{2}+28,000^{2}} \text { or sbout } 24,000
$$

Estimated sampling variability for the major labour force characteristics by size or estimate

| Size of estimato | General sampling variabilly |  | $\begin{aligned} & \text { General sampling } \\ & \text { varisbility } \\ & +40 \%(1) \end{aligned}$ |  |
