THE LABOUR FORCE
MAY 1971

In the week ended May 22, 1971, the Canadian labour force was estimated at $8,627,000$. This total included $8,084,000$ persons employed for all or part of the week and 543,000 unemployed persons. Unemployment in May was 6.3 per cent of the labour force.

On a seasonally-adjusted basis the May unemployment rate was also 6.3 , down from 6.7 in April and near the levels of the first months of the year. Regionally, rates were down in British Columbia and Quebec and little changed in Ontario, and the Atlantic and Prairie Regions

The seasonally-adjusted employment level at $8,025,000$ in May was up 93,000 from April but was only marginally higher than the levels of the winter months.

(continued on page 8)

## Technical Notes <br> Scope of Labour Force Survey

The statistics contained in this report are based on information obtained through a sample survey of households. Interviews are carried out in about 30,000 households chosen by area sampling methods across the country(1). The Labour Force Survey, started in November 1945, was taken at quarterly intervals until November 1952. Since then it has been carried out monthly. Estimates of employment, unemployment and non-labour force activity refer to the specific week covered by the survey each month.

The sample used in the surveys of the labour force has been designed to represent all persons in the population 14 years of age and over residing in Canada, with the exception of: residents of the Yukon and Northwest Territories, Indians living on
reserves, inmates of institutions and members of the armed forces. These excluded categories amount to about three per cent of the total population 14 years of age and over.

Estimates derived from a sample survey are subject to sampling and non-sampling errors. Aspects of this subject in relation to the Labour Force Survey are reviewed under "Reliability of Estimates" on page 8.
(1) For a comprehensive description of the design of the Labour Force Survey, see Dominion Bureau of Statistics, Canadian Labour Force Survey = Methodology, Catalogue No. 71-504, Otrawa, 1965.

## Labout Force Statistics

Contents of the Tables - The results of the survey are presented in the tables on pages 4 to 7 of this report.

Canada, Labour Force (pares 4 and 5). Tables 1 to 3 refer to the labour force, employment and unemployment and contain labour force participation and unemployment rates.

Canada, Employed (page 6). Tables 4 to 6 contain further detail on employment.

Canada, Unemployed (page 7). Table 7 contains further detail on unemployment.

Regions, Labour Force (page 7). Table 8 contains labour force data for the regions.

Supplementary Data - Erom time to time, additional data on particular aspects of the labour force or its components will be obtained. Such material, as it becomes avallable, will be either included in this report or released in separate reports.

Other Data Available - In addition to the published statistics, there is a considerable amount of data which can be obtained on request. Following is a list of material avallable.

For Canada only:

1. Age and sex distributions.
2. Marital status and sex distributions.
3. Employed -
(a) Reasons for working less than full-time.
(b) Hours worked by sex for total employed, agriculture and non-agriculture, and for paid workers, non-agriculture.
(c) Industry and occupation groups, by sex for total employed and for paid workers.
4. Persons not in the labour force by category.

## For regions:

5. Labour force: by age; by sex, agricultural and nonagricultural.
Employed: by age.

## For individual provinces of Atlantic and Prairie regions:

6. Population 14 years of age and over and labour force: by sex.
Total employed, total unemployed, and total persons not in labour force.

## Definitions and Explanations

Labout Force - The civilian labour force is composed of that portion of the civilian noninstitutional population 14 years of age and over who, during the reference week, were employed or unemployed.

Employed - The employed includes all persons who, during the reference week:
(a) did any work for pay or profit;
(b) did any work which contributed to the running of a farm or business operated by a related member of the household; or
(c) had a job, but were not at work, because of bad weather, illness, industrial dispute, or vacation, or because they were taking time off for other reasons.
l'ersons who had jobs but did not work during the reference week and who also looked for work are included in the unemployed as persons without work and seeking work.

Unemployed - The unemployed includes all persons who, through the reference week:
(a) were without work and seeking work, i.e., did not work during the reference week and were looking for work; or would have been looking for work except that they were temporarily ill, were on indefinite or prolonged layoff, or believed no suitable work was avallable in the community; or
(b) were temporarily laid off for the full week, 1.e., were waiting to be called back to a job from which they had been laid off for less than 30 days.

Not in the Labour Force - Those not in the labour force include all civilians 14 years of age and over (exclusive of institutional population) who are not classifled as employed or unemployed. This category includes those: going to school; keeping house; too old or otherwise unable to work; and voluntarily idle or retired. Housewives, students and others who worked part-time are classified as employed. If they looked for work they are classified as unemployed.

Note: Due to the introduction of revised weighting factors in March 1965, small adjustments have been made to estimates published before that time. See the March 1965 edition of this report, page 8.

(1) "S.D." = Standard deviation. For explanation, see "Reliability of Estimates", page 8.
(2) Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories.
(3) The labour force as a percentage of the populatlon 14 yemrs of sge and over.
(4) The unemployed as a percentage of the labour force
r Revised.
Note: With the exception of Table 2 all statistics refe: co a poctfin teak, she iacc try of wheh ia indicated. The sums of individual items may not always equal the totals because of rounding.

Note: Due to the introduction of revised weighting factors in March 1965, small adjustments have been made to estimates published before that time.
See the March 1965 edition of this report, page 8.

Note: Since late 1962, statistics in Table 5 have been published on a 3 -month average basis. However since January 1966, it has been possible to provide monthly estimates of the employed by industry. Accordingly, beginning with the February 1968 report, the statistics in Table 5 refer to the monthly reference periods. Industry estimates on the 3 -month average basis are avallable on request from the Labour Force Survey Section.

(1) "S.D." = Standard deviation. For explanation, see "Reliability of Estimates", page 8. (2) In April 1971, May 1970 and 1969, an unusually large number worked less than 35 hours due to Easter Monday and the Queen's Birthday being in the reference week. (3) Economic reasons for not working 35 hours or more include short time, layoff for part of the week and termination or start of employment during. the week. (4) Other reasons for not working 35 hours or more include illness, bad weather, industrial dispute, vacation, and reasons such as a statutory holiday in the week.
Note: The alphabetic symbol following each estimate in table 6 indicates its standard deviation.
For explanation, see "Reliability of Estimates", page 8.

Note: Due to the introduction of revised weighting factors in March 1965 ,
small adjustments have been made to estimates published before that time.
See the March 1965 edition of this report, page 8.

(1) "S.D." = Standard deviation. For explanation, see "Reliability of Estimates", page 8.

Note: The alphabetic symbol following each estimate in table 8 indicates its standard deviation. For explanation, see "Reliability of Estimates", page 8.

## (a) Sampling Error

## Reliability of Estimates

The estinates in this report are based on a sample of households. Somewhat different figures might have been obtained if a complete census had been taken using the same questionnaires, interviewers, supervisors, processing, etc. as those actually used in the Labour Force Survey. This difference is called the sampling error of the estimates. In the design and processing of the Labour Force Survey extensive efforts have been made to minimize the sampling error. The sampling error (expressed as a per cent of the estimate it refers to) is not the same for all estimates; of two estimates the larger one will likely have a smaller per cent sampling error and of two estimates of the sage size the one referring to a characteristic more evenly 11 stributed across the country will tend to have a smaller per cent sampling variability. Also, estimates relating to age and sex are usually more rellable than other estimates of comparable size.

## (b) Non-sampling Errors

Errors, which are not related to sampling, may occur at almost every phase of a survey operation. Interviewers may wisunderstand instructions, respondents may make errars in answering questions, the answers may be incarrectly entered on the questionnaltes and errors may be introduced in the processing and tabulations of the data. All these errors are called non-sampling errors. Some of the non-sampling errors will usually balance out over a large number of observalions but systematically occuring errors will contribute to blases. Non-sampling errors can be reduced by a careful design of questionnalres, intensive training and supervision of interviewers sad a tharough contral of the processing operation. In general, the more personal and more subjective inquiries are subject to larger errors. Also, data referifng to persons with less stable labour force status will have relatively large non-sampling errors.

## (c) Alphabetic Indicators of Standard Deviation

The sampling etror, as described under (a) is not known. A quantity, called the standard deviation, can however be ustimated from ample data itself. The standard deviation of an estimate is a statistical measure of its sampling error. It also partially measures the effect on non-sampling errors, but docs not reflect any systematic blases in the data. The chences are about 68 out of 100 that the difference between a sample estimate and the corresponding census figure would be leas than the standard deviation. The chances are about 95 out of 100 that the difference would be less than twice the standard deviation and about 99 out of 100 that it would be less than $21 / 2$ times as large.

The standard deviations of the estimates, expressed as a per cent of the estimates, are indicated by letters. The letter "a" Indicates that the standard deviation ie smaller
than 0.5\% of the estimat", the lotier "b" indtcates that the standard deviation is between $0.6 \%$ and $1.0 \%$ of the estimate and so on as shown in the table below.

| Alphabetic designation of per cent standard deviations |
| :---: |
| Alphabetic indicator |
| a Per cent standard deviation |
| b |
| c |
| d |
| e |
| f |
| g |

The actual standard deviation of an estimate is not the same each month. Since the standard deviacions of the current estimates are not avallable at the time when thie report 1 a published, the alphabetic indicators are based on the average standard deviations during the last year. They should, therefore, be interpreted only as indicacions of the order of magnitude of the standard deviations.

## (d) Standard Deviation of Month-to-Month Changes

A rough upper limit for the standard deviation of the difference (change) between two estimates referring to two months up to a year apart may also be indicated using the table above. For most characteristics published in this report the standard deviation of the difference between two estimates is likely to be somewhat smaller than the standard deviation of the smaller of the two estimates or in the immedtately preceding range.

For example, suppose that a hypothetical estimate in May and June was 513,000 and 625,000 respectively and the per cent scandard deviation of both estimates was indscated by the letter "c", 1.e. it was between $1.1 \%$ and $2.5 \%$. The difference between the May and June estimates ( 112,000 ) would, therefore, have a atandard deviation which would likely be smallew than $2.5 \%$ of 513,000 , i.e. it would likely be smaller than 12,800 .

## (e) Current Estimstes of Standard Deviations

Standard deviations are computed monthly for several estimates and month-to-month changes. These are avallable usually in a few weeks after the publication of this report and can be obtained on request, Beginning with 1966, an annual report on the stsidard deviations during the last year will be released.
