NOTESScope of Labour Force Survey

The statistics contained in this report are based on information obtained through a sample survey of households. Interviews are carried out in about 56,000 representative households across the country.

The Labour Force Survey, started in November 1945, was taken at quarterly intervals until November 1952. Since then it has been carried out monthly.

Beginning in January 1976, following more than 3 years of development, substantial revisions to the labour force survey were introduced. Details of these changes are available on request from the Labour Force Survey Division, Statistics Canada.

Estimates of employment, unemployment and non-labour force activity refer to the specific week covered by the survey each month, normally the week containing the 15th day.

The sample used in the surveys of the labour force has been designed to represent all persons in the population 15 years of age and over residing in Canada, with the exception of the following: residents of the Yukon and Northwest Territories, persons living on Indian reserves, inmates of institutions and full-time members of the armed forces.

Self-Representing Units (SRU's) - The SRU's are comprised of those cities whose 1971 populations exceeded provincially determined limits, as well as a small number of cities not meeting the size criteria but possessing unique characteristics. Each is represented in the survey by a sample of its own population and hence the name self-representing. The limits are as follows: Newfoundland - 5,000; Prince Edward Island, Nova Scotia and New Brunswick - 10,000; Quebec and Ontario - 25,000; Manitoba, Saskatchewan, Alberta, and British Columbia - 12,000.

Non Self-Representing Units (NSRU's) - The NSRU's are the areas outside the SRU's containing rural areas and small urban centers.

A comprehensive description of the design of the Labour Force Survey and a complete list of SRU's, can be found in Methodology of the Canadian Labour Force Force Survey, Statistics Canada, Catalogue No. 71-526, Ottawa, 1976.

NOTAChamp de l'enquête sur la population active

La statistique publiée ici est fondée sur une enquête mensuelle menée auprès d'environ 56,000 ménages représentatifs dans tout le pays.

L'enquête sur la population active, lancée en novembre 1945, a eu lieu à intervalles de trois mois jusqu'à novembre 1952. Depuis lors, elle a lieu tous les mois.

Après plus de 3 ans d'élaboration, des changements importants ont été apportés à l'enquête sur la population active, à partir de janvier 1976. Des détails de ces changements sont disponibles sur demande à la Division de l'enquête sur la population active de Statistique Canada.

Les estimations du nombre de personnes occupées, du nombre de chômeurs et du nombre d'inactifs portent sur la semaine de référence de l'enquête mensuelle, habituellement la semaine incluant le 15e jour du mois.

L'échantillon retenu dans les enquêtes sur la population active représente toutes les personnes de 15 ans et plus résidant au Canada, à l'exception des résidents du Yukon et des Territoires du Nord-Ouest, des personnes vivant dans des réserves indiennes, des pensionnaires d'institutions et des membres à plein temps des Forces armées.

Unités autoreprésentatives (UAR) - Les UAR comprennent les villes dont la population en 1971 dépassait des limites établies à l'échelle provinciale, ainsi qu'un petit nombre de villes qui ne répondent pas à ce critère mais qui possèdent des caractéristiques uniques. Chaque ville est représentée dans l'enquête par un échantillon de sa propre population, d'où le qualificatif "autoreprésentative". Voici les limites: Terre-Neuve - 5,000 habitants; Île-du-Prince-Édouard, Nouvelle-Ecosse et Nouveau-Brunswick - 10,000 habitants; Québec et Ontario - 25,000 habitants; Manitoba, Saskatchewan, Alberta et Colombie-Britannique - 12,000 habitants.

Unités non autoreprésentatives (UNAR) - Les UNAR sont les régions situées à l'extérieur des UAR et comprenant des régions rurales et de petits centres urbains.

On trouvera une explication détaillée de la méthodologie de l'enquête sur la population active, et la liste complète des UAR, dans Méthodologie de l'enquête sur la population active du Canada, Statistique Canada n° 71-526F au catalogue, Ottawa, 1976.

Définitions et explicationsPopulation active

La population active comprend la partie de la population civile hors institution âgée de 15 ans et plus qui avait un emploi ou était en chômage pendant la semaine de référence.

Personnes occupées

Entrent dans cette catégorie toutes les personnes qui, pendant la semaine de référence:

- a) ont fait un travail<sup>1</sup> quelconque
- b) avaient un emploi mais n'étaient pas au travail pour l'une des causes suivantes:
  - maladie ou invalidité
  - obligations personnelles ou familiales
  - mauvais temps
  - conflit du travail
  - vacances

(1) Voir la référence à la fin de la section "Nota".

- other reason not specified above (excludes persons on layoff and persons whose job attachment was to a job to start at a definite date in the future).

#### Unemployed

The unemployed includes those persons who during the reference week:

- (a) were without work, had actively looked for work in the past four weeks (ending with reference week), and were available<sup>2</sup> for work.
- (b) had not actively looked for work in the past four weeks but had been on layoff<sup>3</sup> for twenty six weeks or less and were available<sup>2</sup> for work.
- (c) had not actively looked for work in the past four weeks but had a new job to start in four weeks or less from reference week, and were available<sup>2</sup> for work.

#### Not in the Labour Force

That portion of the civilian non-institutional population 15 years of age and over who, during the reference week were neither employed nor unemployed.

#### Unemployment Rate

The unemployment rate represents the number of unemployed persons as a per cent of the labour force. The unemployment rate for a particular group (age, sex, marital status, etc.) is the unemployment in that group expressed as a per cent of the labour force for that group.

#### Participation Rate

The participation rate represents the labour force as a percentage of the population 15 years of age and over. The participation rate for a particular group (age, sex, marital status, etc.) is the labour force in that group expressed as a percentage of the population for that group.

#### Employment/Population Ratio

The employment/population ratio represents employment as a percentage of the population 15 years of age and over. The employment/population ratio for a particular group (age, sex, marital status, etc.) is the employment in that group expressed as a percentage of the population for that group.

#### Industry and Occupation

The Labour Force Survey provides information about the occupation and industry attachment of the employed and unemployed. In this report, tables are given relating to the employed by industry and occupation. These statistics are based on the 1971 Census Classification of Occupations and the 1970 Standard Industrial Classification.

#### The Unemployed: Family Data

A family is defined as "a group of two or more persons who are living together in the same dwelling and who are related by blood, marriage or adoption". A person living alone or who is related to no one else in the dwelling where he lives is classified as an "unattached individual". The head of a family is determined by the respondent's perception of headship and as such is solely a statistical device which has no economic connotation. (A more detailed description of the derivation of family data is available on request.)

(2), (3) See footnotes at end of "Notes" section.

- autre raison non précisée ci-dessus (à l'exception des personnes mises à pied et des personnes qui devaient commencer à travailler à une date future déterminée).

#### Chômeurs

Entrent dans cette catégorie les personnes qui, pendant la semaine de référence:

- a) étaient sans travail, avaient activement cherché du travail au cours des quatre dernières semaines (y compris la semaine de référence) et étaient prêtes à travailler<sup>2</sup>.
- b) n'avaient pas activement cherché de travail au cours des quatre dernières semaines, mais avaient été mises à pied<sup>3</sup> depuis vingt-six semaines ou moins et étaient prêtes à travailler<sup>2</sup>.
- c) n'avaient pas activement cherché de travail au cours des quatre dernières semaines, mais devaient commencer à travailler à un nouvel emploi dans quatre semaines ou moins à compter de la semaine de référence et étaient prêtes à travailler<sup>2</sup>.

#### Inactifs

Les inactifs constituent la partie de la population civile hors institution âgée de 15 ans et plus qui n'avaient pas d'emploi mais n'étaient pas en chômage pendant la semaine de référence.

#### Taux de chômage

Le taux de chômage représente le nombre de chômeurs en pourcentage de la population active. Le taux de chômage d'un groupe particulier (âge, sexe, état matrimonial, etc.) est le chômage de ce groupe exprimé en pourcentage de la population active du même groupe.

#### Taux d'activité

Le taux d'activité représente la population active en pourcentage de la population de 15 ans et plus. Le taux d'activité d'un groupe particulier (âge, sexe, état matrimonial, etc.) est la population active de ce groupe exprimée en pourcentage de la population du même groupe.

#### Rapport emploi/population

Le rapport emploi/population représente l'emploi en pourcentage de la population de 15 ans et plus. Le rapport emploi/population d'un groupe particulier (âge, sexe, état matrimonial, etc.) est l'emploi de ce groupe exprimé en pourcentage de la population du même groupe.

#### Branche d'activité et profession

L'enquête sur la population active fournit des renseignements sur la profession et la branche d'activité des personnes occupées et des chômeurs. Le présent bulletin contient des tableaux relatifs aux personnes occupées par branche d'activité et par profession. Ces statistiques sont fondées sur la Classification des professions du recensement de 1971 et sur la Classification des activités économiques de 1970.

#### Les chômeurs: Statistique familiale

Une famille est "un groupe de deux personnes et plus qui vivent ensemble dans le même logement et qui sont apparentées par le sang, le mariage ou l'adoption". Une personne qui vit seule ou qui n'est apparentée à aucun occupant du logement où elle demeure est classée comme "personne seule". On établit qui est le "chef de famille" en demandant à l'enquêté qui est, selon lui, la personne qui joue ce rôle. Ce concept n'a aucune connotation économique; il ne s'agit que d'un mécanisme statistique. (On peut obtenir sur demande une description plus détaillée du calcul des données sur les familles.)

(2), (3) Voir les références à la fin de la section "Nota".

### Rounding

The "normal" rounding procedure is used in the Labour Force Survey. Unadjusted participation and unemployment rates and annual averages are calculated from unrounded figures (i.e., estimates in units), but published figures are rounded to thousands. Therefore the sum of individual rounded items may not always equal the total.

### Reference dates

As mentioned in the first paragraph of these notes, the estimates derived from the Labour Force Survey refer to a specified week covered by the survey each month. The following table gives the reference weeks for the years 1979, 1980 and 1981 inclusive.

### Arrondissement

On se sert de la procédure d'arrondissement "normal" dans l'enquête sur la population active. Les taux d'activité et de chômage non ajustés et les moyennes annuelles sont calculés à partir de chiffres non arrondis (c'est-à-dire des estimations en unités). Cependant, les estimations publiées sont arrondies en milliers. La somme des composantes individuelles n'est pas toujours égale au total à cause de l'arrondissement.

### Dates de référence

Comme il était mentionné dans le premier paragraphe, les estimations tirées de l'enquête sur la population active se rapportent à une semaine précise qui sert de référence chaque mois. Le tableau ci-après indique les semaines de référence pour les années 1979, 1980 et 1981 inclusivement.

### Seasonal Adjustment

Fluctuations in economic time series are caused by seasonal, cyclical and irregular movements. A seasonally-adjusted series is one from which seasonal movements have been eliminated. Seasonal movements are defined as those which are caused by regular annual events such as climate, crop cycles, holidays and vacation periods. It should be noted that the seasonally-adjusted series contains irregular as well as longer-term cyclical fluctuations.

The seasonal-adjustment program is a complicated computer program which differentiates between these seasonal, trend and irregular movements in a series over a number of years and, on the basis of past movements, estimates appropriate seasonal factors for current data. On an annual basis, the entire historic series of seasonally-adjusted data is revised in light of the most recent information on changes in seasonality. These annual revisions are published each year in "Historical labour force statistics - actual data, seasonal factors, seasonally-adjusted data" (Catalogue No. 71-201).

Canada and provincial total employment, unemployment and labour force, seasonally-adjusted, are derived by the summation of the appropriate and where available seasonally-adjusted figures for men 15-24, men 25+, women 15-24, and women 25+. The participation rate is seasonally-adjusted by the "indirect" method, i.e. the sum of the seasonally-adjusted employment and unemployment as a per cent of the population. Rounded figures are used as input for seasonal adjustment, except for some small series.

### Reliability of data

#### Sampling Error

The estimates in this report are based on a sample of households. Somewhat different figures might have been obtained if a complete census had been taken

### Désaisonnalisation

Les fluctuations de séries chronologiques économiques sont causées par des mouvements saisonniers, cycliques et irréguliers. Une série désaisonnalisée est une série dont on a éliminé les effets des mouvements saisonniers. Les mouvements saisonniers sont ceux qui sont causés par des événements annuels réguliers comme les changements de température, les cycles agricoles et les vacances. A noter que la série désaisonnalisée contient des fluctuations irrégulières ainsi que des fluctuations cycliques à long terme.

Le programme de désaisonnalisation est un programme informatique complexe qui permet de déceler les mouvements saisonniers, tendanciels et irréguliers au cours d'une période de plusieurs années et, à la lumière des mouvements passés, d'estimer les coefficients saisonniers appropriés pour l'année en cours. Sur une base annuelle, toute la série chronologique des données désaisonnalisées est révisée à la lumière des renseignements les plus récents sur les changements de saisonnalité. Ces rectifications sont publiées chaque année dans "Statistique chronologiques sur la population active - chiffres réels, facteurs saisonniers et données désaisonnalisées" (n° 71-201 au catalogue).

Le total désaisonné de l'emploi du chômage et de la population active du Canada et des provinces est tiré de la somme des chiffres désaisonnalisés appropriés là où ils sont disponibles pour les hommes de 15-24, les hommes de 25+, les femmes de 15-24 et les femmes de 25+. Le taux d'activité est désaisonné par la méthode "indirecte", c'est-à-dire la somme de l'emploi et du chômage désaisonnalisés comme pourcentage de la population. On se sert de chiffres arrondis pour l'ajustement saisonnier, sauf pour quelques séries moins considérables.

### Fiabilité des données

#### Erreur d'échantillonnage

Les estimations présentées ici sont fondées sur un échantillon de ménages. On aurait pu obtenir des chiffres légèrement différents si on avait fait un recensement complet à l'aide des

using the same questionnaires, interviewers, supervisors, processing methods, etc. as those actually used in the Labour Force Survey. This difference is called the sampling error of the estimates. In the design and processing of the Labour Force Survey extensive efforts have been made to minimize the sampling error. The sampling error (expressed as a per cent of the estimate it refers to) is not the same for all estimates; of two estimates the larger one will likely have a smaller per cent sampling error and of two estimates of the same size the one referring to a characteristic more evenly distributed throughout the population will tend to have a smaller per cent sampling variability. Also, estimates relating to age and sex are usually more reliable than other estimates of comparable size.

Data based on very small samples are not published and are indicated in the tables by (...).

#### Non-sampling Errors

Errors which are not related to sampling may occur at almost every phase of a survey operation. Interviewers may misunderstand instructions, respondents may make errors in answering questions, the answers may be incorrectly entered on the questionnaires and errors may be introduced in the processing and tabulations of the data. All these errors are called non-sampling errors. Some of the non-sampling errors will usually balance out over a large number of observations but systematically occurring errors will contribute to biases. Non-sampling errors can be reduced by a careful design of questionnaires, intensive training and supervision of interviewers and a thorough control of the processing operation. In general, the more personal and more subjective inquiries are subject to large errors. Also, data referring to persons with less stable labour force status will have relatively large non-sampling errors.

#### Other Factors

Further limitations of the data, including problems of seasonal adjustment, irregularities and rounding are discussed in the article, "The Meaning, Uses and Limitations of the Unemployment Statistics" published in the July 1972 edition of the Canadian Statistical Review.

#### Indicators of Standard Deviation

The sampling error, as described above, is not known. A quantity, called the standard deviation, can however be estimated from sample data itself. The standard deviation of an estimate is a statistical measure of its sampling error. It also partially measures the effect on non-sampling errors, but does not reflect any systematic biases in the data. The chances are about 68 out of 100 that the difference between a sample estimate and the corresponding census figure would be less than the standard deviation. The chances are about 95 out of 100 that the difference would be less than twice the standard deviation and about 99 out of 100 that it would be less than 2 1/2 times as large.

Alphabetic symbols of standard deviation are used in this publication to give an indication of the reliability of the estimates and are based on a 12-month average of the per cent standard deviations in the previous calendar year.

The letter "A" indicates that the estimate is very reliable; the letter "B" indicates that the data is reliable but to a somewhat lesser degree than the "A" category; and so on. Generally, published estimates are in the categories "A" to "F" and should be considered reliable enough for most purposes. Some data with a higher variability (in the "G" and "H" categories) are reliable enough for some purposes,

mêmes questionnaires, des mêmes enquêteurs, des mêmes méthodes d'exploitation, etc. que ceux qu'on a effectivement utilisés pour l'enquête sur la population active. Cette différence s'appelle l'erreur d'échantillonnage. Dans le plan et la mise en oeuvre de l'enquête sur la population active, rien n'a été négligé pour réduire au minimum l'erreur d'échantillonnage. L'erreur d'échantillonnage (exprimé en pourcentage de l'estimation visée) n'est pas la même pour toutes les estimations; de deux estimations, la plus forte comporte vraisemblablement la plus faible erreur d'échantillonnage et de deux estimations du même ordre, celle qui porte sur la caractéristique la plus uniformément répartie dans la population présente ordinairement le pourcentage le moins élevé de variabilité due à l'échantillonnage. De même, les estimations relatives à l'âge et au sexe sont habituellement plus fiables que d'autres estimations de taille comparable.

Les données provenant d'échantillons très réduits ne sont pas publiées; dans les tableaux, elles sont remplacées par le signe (...).

#### Erreur non due à l'échantillonnage

D'autres erreurs, qui n'ont pas trait à l'échantillonnage, peuvent se produire à presque toutes les étapes d'une enquête. Les enquêteurs peuvent mal comprendre les instructions, les enquêtés peuvent donner des réponses erronées, les réponses peuvent être mal notées sur les questionnaires et d'autres erreurs peuvent être commises lors de l'exploitation et de la totalisation des données. Toutes ces erreurs s'appellent des erreurs non dues à l'échantillonnage. Certaines des erreurs non dues à l'échantillonnage s'annulent après un grand nombre d'observations, mais les erreurs systématiques engendrent des biais. Il est possible de réduire ce genre d'erreurs par une rédaction soignée des questionnaires, par une formation et une surveillance intensives des enquêteurs et par un contrôle serré de l'exploitation. En général, plus les questions prennent un caractère personnel et subjectif, plus les erreurs sont considérables. De même, les données relatives à des personnes dont la situation est moins stable présenteront un nombre relativement élevé d'erreurs non dues à l'échantillonnage.

#### Autres facteurs

D'autres limitations concernant les données, tels les problèmes de désaisonnement, les irrégularités et l'arrondissement des chiffres, sont étudiés dans l'article "Signification, utilisations et limitations des statistiques sur le chômage" paru dans l'édition de juillet 1972 de la Revue statistique du Canada.

#### Indicateurs de l'écart type

L'erreur d'échantillonnage, décrite ci-dessus n'est pas connue. Toutefois, il est possible d'estimer une quantité, appelée l'écart type, à partir des données mêmes du sondage. L'écart type d'une estimation est une mesure statistique de son erreur d'échantillonnage. Il mesure aussi partiellement l'effet des erreurs non dues à l'échantillonnage, mais ne reflète pas les biais systématiques. Il y a une probabilité de 68 % que la différence entre une estimation fondée sur un échantillon et le chiffre réel correspondant soit inférieure à l'écart type. Il y a une probabilité de 95 % que la différence soit moins de deux fois l'écart type et d'environ 99 % qu'elle soit moins de deux fois et demi l'écart type.

Des symboles littéraux de l'écart type sont utilisés dans ce bulletin comme indicateurs de la fiabilité des estimations et sont fondés sur une moyenne de douze mois des écarts types exprimés en pourcentage pour l'année civile précédente.

La lettre "A" indique qu'il s'agit d'une estimation très fiable; la lettre "B", que l'estimation est fiable mais à un degré moindre qu'une estimation de la catégorie "A" et ainsi de suite. De façon générale, les estimations publiées rentrent dans les catégories "A" à "F" et peuvent être considérées comme suffisamment fiables pour la plupart des utilisations que l'on a fait. Ce bulletin contient également certaines données de variabilité plus élevée (dans les catégories "G" et "H"),

however they should be used with great caution. Therefore, in any subsequent use, specific reference should be made to the higher sampling variability of data in the "G" and "H" categories.

The letter "J" indicates either that the estimate has a variability of more than 33.3 % and/or is less than 4,000. Estimates subject to sampling error of this magnitude are not published.

The table below shows the alphabetic categories in terms of their per cent standard deviations. For example, a letter "B" beside an estimate indicates that one standard deviation is in the range 0.6 to 1.0 % of the estimate.

la fiabilité de ces dernières données est suffisante pour certaines utilisations, il faut les traiter avec beaucoup de prudence. Par conséquent, chaque fois qu'on les utilisera par la suite, il faudra préciser que leur variabilité d'échantillonnage est plus élevée.

La lettre "J" indique soit que l'estimation a une variabilité de plus de 33.3 % et/ou que celle-ci est plus petite que 4,000. Les estimations qui sont sujettes à des erreurs d'échantillonnage de cette envergure ne sont pas publiées.

Le tableau ci-après donne le classement des catégories selon leur écart type exprimé en pourcentage. Ainsi, la lettre "B" à côté d'une estimation signifie qu'un écart type est compris entre 0.6 et 1.0 % de l'estimation.

1. Work includes any work for pay or profit that is, paid work in the context of an employer-employee relationship, or self-employment. It also includes unpaid family work where unpaid family work is defined as unpaid work which contributed directly to the operation of a farm, business or professional practice owned or operated by a related member of the household.

2. Persons in this group meeting the following criteria are regarded as available:

(i) were full-time students seeking part-time work who also met condition (ii) below. (Full-time students looking for full-time work are classified as not available for work in the reference week.)

(ii) reported that there was no reason why they could not take a job in reference week, or, if they could not take a job it was because of "own illness or disability", "personal or family responsibilities", or already had a job.

3. Persons are classified as being on layoff only when they expect to return to the job from which they were laid off.

1. On entend par "travail" tout travail fait contre rémunération ou en vue d'un bénéfice, c'est-à-dire le travail fait contre rémunération pour un employeur ou à son propre compte. Il peut également s'agir d'un travail familial non rémunéré, c'est-à-dire d'un travail non rémunéré qui contribue directement à l'exploitation d'une ferme, d'une entreprise ou d'un bureau professionnel, qui est possédé ou exploité par un membre apparenté du ménage.

2. On considère comme prêtes à travailler les personnes de ce groupe qui:

(i) étaient étudiants à plein temps cherchant du travail à temps partiel et qui répondent également au critère (ii) ci-dessous. (Les étudiants à plein temps qui cherchaient du travail à plein temps ne sont pas considérés comme ayant été prêts à travailler pendant la semaine de référence.)

(ii) ont déclaré qu'il n'y avait aucune raison pour laquelle elles ne pouvaient prendre un emploi pendant la semaine de référence; ou ne pouvaient en prendre un en raison "d'une maladie ou d'une invalidité", "d'obligations personnelles ou familiales", ou "parce qu'elles avaient déjà un emploi".

3. On considère comme mises à pied seules les personnes qui s'attendent à réintégrer l'emploi qu'elles occupaient avant d'être mises à pied.
