## INTRODUCTION

For some years, a selection of seasonally adjusted labour force statistics has been published regularly in the Canadian Statistical Review. Because of space considerations, the number of series that could be accommodated in that publication was necessarily limited. It was considered desirable to make a wider range of seasonally adjusted series available to users of labour force data. This publication is designed to serve this purpose.

The seasonally unadjusted statistics contained in this report are based on information obtained through a sample survey of households. Interviews are carried out in nearly 35,000 households chosen by area sampling methods across the country. The Labour Force Survey, started in November 1945, was taken at quarterly intervals until November 1952. Since then it has been carried out monthly. Estimates of employment, unemployment and non-labour force activity refer to the specific week covered by the survey each month.

The sample used in the surveys of the labour force has been designed to represent all persons in the population 14 years of age and over residing in Canada, with the exception of: residents of the Yukon and Northwest Territories, Indians living on reserves, inmates of institutions and members of the armed forces. These excluded categories amount to about three per cent of the total population 14 years of age and over.

Estimates derived from a sample survey are subject to sampling and non-sampling errors. Aspects of this subject as well as definitions and explanations relating to the Labour Force Survey may be obtained by referring to the monthly publication, "The Labour Force", catalogue number 71-001. For a more detailed description of the survey reference is made to, "Canadian Labour Force Survey, Methodology", catalogue number 71-504 (occasional).

A number of Labour Force Survey series have been processed using the X9 Version of the United States Bureau of the Census Method II Seasonal Adjustment Computer Program(1). Attention is drawn to the fact that the seasonally adjusted series in this document have not been subjected to review or analysis. They may differ from figures published in other DBS reports because of minor differences in procedure and treatment of the data.

## INTRODUCTION

Depuis quelques années, un choix de statistiques désaisonnalisées concernant la main-d'oeuvre sont publiées régulièrement dans la Revue Statistique du Canada. En raison de l'espace, le nombre de séries statistiques insérées dans la Revue était restreint. On a cru désirable d'offrir une plus grande variété de séries désaisonnalisées aux usagers de ce type de données. La présente publication est rédigée à cette fin.

Les données non désaisonnalisées contenues dans le présent rapport sont fondées sur des renseignements obtenus au moyen d'une enquête fragmentaire faite auprès des ménages. Environ 35,000 ménages choisis par échantillonnage aréolaire à travers le pays sont interviewés. Le relevé de la main-d'oeuvre, inauguré en novembre 1945, a été effectué trimestriellement jusqu'à novembre 1952. Depuis lors, il est fait tous les mois. Les estimations de l'emploi, du chômage et du nombre de personnes inactives portent sur une semaine déterminée chaque mois.

L'échantillon qui sert au relevé de la main-d'oeuvre est conçu de façon à représenter toutes les personnes âgées de 14 ans et plus qui habitent au Canada, exception faite des habitants du Yukon et des Territoires du Nord-Ouest, des Indiens des réserves, des pensionnaires des institutions et des militaires. Ces catégories exclues représentent environ 3 p. 100 de la population totale âgée de 14 ans et plus.

Les estimations tirées d'une enquête fragmentaire demeurent sujettes aux erreurs de sondage et aux erreurs non dues au sondage. Les différents aspects de ce sujet ainsi que les définitions et les explications relatives au relevé de la main-d'oeuvre paraissent dans la publication mensuelle intitulée La main-d'oeuvre, n° de catalogue 71-001F. Une description plus détaillée du relevé est faite dans le "Canadian Labour Force Survey, Methodology", n° de catalogue 71-504 (publication irrégulière).

Un certain nombre de séries de l'enquête sur la main-d'oeuvre ont été traitées à l'aide de la version X9 du United States Bureau of the Census Method II Seasonal Adjustment Computer Program(1). On voudra bien noter que les séries désaisonnalisées qui font l'objet du présent document n'ont pas été revues ni analysées. Elles s'écartent parfois des chiffres publiés dans d'autres rapports du B.F.S. à cause de légères différences dans le mode de traitement de ces données.

The seasonally adjusted labour force may be obtained by direct adjustment or by summing employment and unemployment, seasonally adjusted. The former method has been applied to data appearing in this publication. In other DBS reports the summation method has been used for the sake of convenience.

Appearing in the appendix are tables giving the seasonally adjusted labour force, obtained by summation, for Canada and the five regions. Also included is the seasonally adjusted unemployment rate for Canada.

For each labour force series included in this report, four tables are presented as follows:

1. The seasonally unadjusted data. All estimates derived from the Labour Force Survey are rounded to thousands.
2. The uncentered twelve-month moving average of the unadjusted data. In this table, the annual average appears in the column for the month of June for each calendar year.
3. The final seasonal adjustment factors. Included in this table are factors estimated one year ahead.
4. The final seasonally adjusted series. This table is obtained by dividing the unadjusted data each month by the corresponding seasonal factor.

(1) For a general description of the technique see Julius Shiskin, Electronic Computers and Business Indicators, National Bureau of Economic Research, Inc., Occasional Paper 57.

Le chiffre désaisonnalisé de la main-d'oeuvre peut être obtenu par ajustement direct ou par la sommation des chiffres désaisonnalisés d'employés et de chômeurs. C'est la première méthode qui a été utilisée pour le traitement des données dans le présent ouvrage. Pour des raisons pratiques, la deuxième méthode (la sommation) a été utilisée dans d'autres publications du B.F.S.

Dans l'annexe, on trouvera des tableaux donnant le chiffre désaisonnalisé de la main-d'oeuvre, obtenu par sommation, pour le Canada et les cinq régions. On trouvera aussi le taux désaisonnalisé du chômage au Canada.

Pour chaque série de données présentées dans ce rapport, on trouvera quatre tableaux disposés dans l'ordre suivant:

1. Les données non désaisonnalisées. Toutes les estimations extraites du Relevé de la main-d'oeuvre sont arrondies au millier.
2. La moyenne mobile de 12 mois, non centrée, des données non désaisonnalisées. Dans ce tableau, la moyenne annuelle paraît pour chaque année civile, dans la colonne du mois de juin.
3. Les facteurs finals de désaisonnalisation. Le tableau comprend ~~les facteurs évalués une~~ année à l'avance.
4. La série finale ~~de données désaisonnalisées~~. Ce tableau est obtenu en divisant chaque mois les données non désaisonnalisées par le facteur saisonnier correspondant.

(1) Le lecteur qui désire avoir un aperçu de cette technique n'aura qu'à consulter l'ouvrage de Julius Shiskin, Electronic Computers and Business Indicators, National Bureau of Economic Research, Inc., Occasional Paper 57.
