FOREWORD

This is the second part of Reference Paper, Number 61, "Employment Under the Unemployment Insurance Act" and it supercedes the first part which was published in 1955.

Employment and earnings patterns in relation to the sex and age composition of contributors to unemployment insurance are presented in this reference paper from the inception of the scheme in July, 1941 up to and including March, 1954. As the bulk of paid workers are in covered employments (70% in 1941 rising to 80% in 1954), for many purposes the data for contributors may be used as representative of the wage earning population as a whole.

The material was prepared in the Unemployment Insurance Section of the Labour and Prices Division by Miss Helen Driscoll under the direction of Messrs. N.L. McKellar, and D.J. Bailey.

EMPLOYMENT UNDER THE UNEMPLOYMENT INSURANCE ACT

Year ended March 31, 1954

COMMENTARY

The Canadian Unemployment Insurance Act has been in operation since July, 1941. At the beginning it covered those employed under a contract of service earning less than \$2,000 a year except for such employments as: agriculture, fishing, hunting, trapping, logging, government employees, teachers, policemen, those employed in non-profit institutions, and domestic servants employed in private homes.¹ As experience was gained in administering unemployment insurance the coverage of the Act was extended. By 1954 the earnings ceiling had been raised to \$4,800 a year and it had been removed altogether for those paid on an hourly, daily, weekly, piece rate or similar basis; such groups as those employed in lumbering and logging, stevedoring and inland water transportation were included. During this period also employment in certain covered industries such as manufacturing, construction and transportation had increased markedly so that the insured population had grown from about 70 per cent of all paid workers in 1941 to 80 per cent in 1954.

The information presented in the present bulletin is obtained from the contribution records of insured persons. A continuous 5 per cent sample has been maintained since the inception of the Act following the same persons through year after year and assembling all available data on them. As individuals enter insured employment for the first time they are issued identification numbers which they retain and use in all their contacts with the administration. A sample based upon certain combinations of digits in these numbers obtains information on individuals so long as they are in contact with the scheme and it automatically drops those who leave and picks up its share of the new entrants. The contribution records maintained by the Unemployment Insurance Commission permit the grouping of contributors by classes which correspond to earnings groups. The record also contains the number of days for which the individual contributed each year and thus allows a grouping on the basis of weeks contributed or weeks of recorded insured employment. On the basis of the weeks contributed over the years since the person first entered insurance the annual average number of weeks contributed (the proportion of 52 weeks which the individual has contributed in all years) is computed for each sample person. Thus it is possible to arrange contributors according to their long-term patterns of contribution weeks. Such personal characteristics as age and sex form part of the record for each insured person so that significant differences in patterns of contributions and rates of

earnings can be shown for age groups separately for males and females.

In Table 1 contributors are grouped by average weekly earnings rate and sex for each year from 1942 to 1954 (the year in this instance refers to the fiscal year which ends March 31). It should be noted that the period ended March 31, 1942 was one of 9 months. During the first 9 months 36 per cent of contributors had average weekly earnings of \$26 or more, but by 1954 90 per cent had average weekly earnings of \$27 or more. The earnings of males have been consistently higher than those of females. In 1942 for example 48 per cent of males and 4 per cent of females had earnings of \$26 or more per week and by 1954 the proportions had risen to 96 per cent of males and 72 per cent of females.

The rapid rise in earnings shown by these data came about for a number of reasons. Earnings in general rose quite markedly during the war and post-war period as indicated by the increase in average weekly earnings from \$26.65 in 1941 to \$58.88 in 1954 according to the Bureau's monthly survey of employment and earnings. In addition the groups to which coverage has been extended included those with higher earnings both because the earnings ceiling was successively raised and also that average weekly earnings in logging, stevedoring and public utility operation tend to be above the average for all industries. These extensions of coverage also brought in more male than female additions to the insured population.

Toward the end of the war the proportion of females in the insured population reached an all-time high of about 1 in 3. During the period of readjustment after the war employment of females fell off sharply but in subsequent years employment conditions have been such that more and more females have been drawn into the insured working force. At the present time females constitute about 30 per cent of the insured population and as noted later the new wave of female contributors contains a higher proportion in the age groups over 45. This changing pattern of female employment has had a tendency to depress average weekly earnings for the insured population as a whole.

As would be expected the average number of weeks employed, as indicated by weeks contributed, has been quite stable over the years. The lowest point it reached was 35 weeks in 1949 and the highest was 38 weeks in 1950. In view of the different basis upon which males and females participate in labour force activity it is not surprising that the average weeks contributed is consistently higher for males than for females. Whereas males are employed to a greater extent in seasonal work and other employment subject to interruption from

1. This list gives the main groups excluded from coverage. For a full list see the Unemployment Insurance Act, 1940.

time to time than are females, the turnover among females due to marriage and family responsibilities is much more rapid than among males. Thus in each year it is to be expected that a significant proportion of female insured persons retires from active participation in insured employment and is replaced by new recruits to the female insured population.

At first glance it may seem that the averages of 35 to 38 weeks are unduly low. When considered from the viewpoint of the turnover mentioned above and the smaller normal turnover for males however, in addition to the movements in and out of insured employment by students engaged in summer work and of housewives, farmers, fishermen and others who engage in insured employments seasonally, the averages appear reasonable. It should be noted also that extensions of coverage such as those to lumbering, logging and inland water transportation, as well as increased activity in construction and other resource development activities has maintained if not increased the proportion of seasonal employment within the insured group.

Increasing stability of employment is associated with higher earnings. This positive correlation between stability of employment and higher average weekly earnings is true for both males and females but is more pronounced in the case of females. Chart 1 shows the correlation between employment and earnings, while the distribution of the contributors by earnings class and sex is shown in chart 2.

There is some evidence of a decline in the proportion of young contributors over the years and a corresponding increase in the proportion of those 45 years of age and over, (Table 2). The decline in the proportion of younger workers occurs both for males and females but the increase in the proportion 45 years of age and over is due mainly to an increase in the number of females in that group contributing. In 1942 women 45 and over constituted 7 per cent of all female contributors, while in 1954 they had increased to 15 per cent. The general decline in the importance of young contributors (i.e. those under 20 years of age) is due in part at least to the low birth rates of the late 1920's and 1930's which resulted in smaller additions to the 15 to 19 age group during the 1940's and early 1950's. The effect of the low birth rates 15 to 20 years earlier would have been more apparent during this period had their effect not been offset to some extent by immigration.

During the war years when large numbers of men between 18 and 40 years of age were withdrawn from civilian employment the age distribution of the insured group was somewhat abnormal. For example, in 1942 seventy-five per cent of male contributors were under 45, while in 1943, 1944 and 1945 the proportion of males under 45 years of age declined to about 65 per cent. After the war and the demobilization of the armed forces the proportion of males 45 and under became again about 75 per cent. The age composition of the female contribu-

tors has shown a different pattern. In 1942 ninety percent of the females were under 45 years of age and 25 per cent of them were under 20 years of age. By 1954 the situation was just a little different with 85 per cent of female contributors under 45 years of age and 20 per cent under 20 years of age. The change in the ages of women contributors has been accompanied by differences in the proportion of working women who are married. In 1941¹ about 10 per cent of women gainfully occupied in non-agricultural industry were married, whereas in 1954² thirty-five per cent of females with jobs in non-agricultural industry were married.

Comparison of the age and sex distribution for contributors and for the non-agricultural labour force is shown in chart 3.

If full-time employment is indicated by contributions of 49 to 52 weeks in the year, then from 35 to 40 per cent of contributors are employed full time in insured employment (Table 3), the proportion being slightly smaller in the case of females.

In the remaining tables the new entrants in each year are shown separately from the renewals. A new entrant is an individual to whom an insurance book has been issued for the first time and who therefore has entered the sample during the course of that year. A renewal is an individual for whom a contribution record is received and who is known to have been issued an insurance number in a previous year, although he may not have contributed in the immediately preceding year; this group thus includes re-entrants or revivals. It is clear that since new entrants come into insurance throughout the year their average weeks contributed will tend to be less than 26, whereas the average weeks contributed for the renewals could conceivably be as high as 52. One advantage then of showing the new entrants separately is to remove a tendency toward understatement of the average weeks contributed for those who have been exposed during the whole year. It has the added advantage also of showing the different composition of the new entrant group from that of the insured population as a whole.

In most years new entrants constituted about 10 per cent of all contributors but in particular years (e.g. 1944) in which there were significant extensions of coverage, the new entrants are a higher proportion of the total, (Table 4). (Appendix V, page 54, gives details of increases in coverage throughout the period covered by this bulletin).

One outstanding difference between the new entrants and the main body of the insured population is in age composition, (see Table 5). Except for years in which large groups were brought under the Act only about 10 per cent of new entrants are 45 years of age and over, while 45 per cent are under 20 years of age and another 45 per cent between 20 and 44. The renewal contributors have a quite different age pattern, those under 20 being between

1. Census of Canada 1941.

2. D.B.S. — Labour Force Survey.

10 and 15 per cent, those 45 and over being around 25 per cent, and those 20 to 44 being 60 to 65 per cent.

Table 6 shows that about half the new entrants usually contribute less than 17 weeks in the year, while more than half of the renewals contribute 45 weeks or more. This indicates that many of the new entrants are students who dip into insured employment during summer vacations or are housewives or others who work in seasonal jobs during a relatively short period in the year.

The effect of the more rapid turnover of females in the working force is also evident in the sex composition of new entrants as compared with renewals. Females constitute a higher proportion of new entrants than of renewals.

The earnings of new entrants over the period covered indicates some interesting developments (Table 7). In the earlier years about 50 per cent of male new entrants had earnings of \$26 or more but by 1954 this proportion had risen to 80 per cent. Very few females (about 5 per cent) earned \$26 or more per week in 1944 and about 80 per cent of them had average weekly earnings under \$20, whereas in 1954 about 50 per cent of female new entrants were earning \$27 or more and over 75 per cent earned \$21 or more.

Chart 4 gives the earnings distribution of new entrants and renewals, while chart 5 shows the relative size of the major groups.

In Table 14 a comparison of the basic employment pattern of contributors during the period they have been exposed to unemployment insurance is given for each of the three years 1946, 1950 and 1954. As explained above annual average weeks contributed is computed for each contributor and provides the proportion of the total time he has been exposed that he has contributed in terms of

52 weeks. Up to 1946 more than one-third of the contributors showed an average annual pattern of from 49 to 52 weeks contribution and almost two-thirds showed an average of 40 weeks or more. This pattern is a reflection of the stable employment experienced during the war years in which normal seasonal swings were ironed out and there was little short-time employment. By 1950 only about one-quarter of contributors had an annual average of 49 to 52 weeks and just a little more than one-half had an average of 40 weeks or more. The averages for the period ending in 1954 show a continuation of these tendencies with less than one-fifth of contributors having average annual contributions of 49 weeks or more and less than one-half having 40 weeks or more.

It is interesting to note that each time this compilation was made the proportion of contributors having annual average contributions of from 40 to 48 weeks was about the same (about 30 per cent). It is the categories on each side of this group that manifest the most marked variation, with a tendency for the size of the group working full-time to diminish in recent years, while the group working on the average from 6 months to 9 months of the year (i.e. 27 to 39 weeks) increases. Between 1946 and 1954 those contributing between 27 and 39 weeks on the average almost doubled in importance. This change reflects the influence of increases in coverage which have extended unemployment insurance in industries having greater seasonality of employment, as well as the general increase in employment which has occurred in construction and other industrial divisions subject to slack periods during certain seasons of the year. Thus while unemployment insurance records indicate that seasonal unemployment has become more marked in recent years they probably overstate the extent of that increase because in the earlier years much seasonal dislocation took place outside of the scope of unemployment insurance coverage.

APPENDIX I

Summary of the Act

The Unemployment Insurance Act, as of 1954, applied to all persons employed under a contract of service with the following exceptions: workers in specified industries or occupations such as agriculture, fishing, armed forces, private domestic service and private duty nursing, persons employed on other than an hourly, daily or piece rate basis if earning more than \$4,800 per year and (except by consent of the Unemployment Insurance Commission) employees in a hospital or charitable institution not carried on for the purpose of gain. Employees in covered industries paid by the hour, day

or on piece or mileage rate are insured regardless of amount of earnings.

The plan operates on a coordinated scheme of contributions and benefit based on earnings. The fund from which benefit payments are made is built up from contributions by employers and employees and a government contribution of 1/5 of the combined employer-employee contributions.

The schedules of contribution rates, (effective from July 3, 1950), and of benefit rates, (effective from July 14, 1952) were as follows:

Range of earnings	Weekly contribution rate (cents)		Weekly benefit rate for a person	
	Employer	Employee	Without a dependent	With a dependent
While earning in a week:				
Less than \$9.00	18 (3)	18 (3)	4.20	4.80
\$ 9.00 to \$14.99	24 (4)	24 (4)	6.00	7.50
\$15.00 to \$20.99	30 (5)	30 (5)	8.70	12.00
\$21.00 to \$26.99	36 (6)	36 (6)	10.80	15.00
\$27.00 to \$33.99	42 (7)	42 (7)	12.90	18.00
\$34.00 to \$47.99	48 (8)	48 (8)	15.00	21.00
\$48.00 or more	54 (9)	54 (9)	17.10	24.00

APPENDIX II

Administrative procedure covering collection of contributions

For purposes of administering the Unemployment Insurance Act the Unemployment Insurance Commission operates regional offices in Moncton, Montreal, Toronto, Winnipeg and Vancouver. These Regional Offices are responsible for the general direction of National Employment Service Offices in their respective areas. The local offices serve as the point of contact between insured persons, employers and others and the Unemployment Insurance Commission.

Identification of an individual for purposes of the scheme is facilitated by an insurance number assigned at his time of first contact with the Commission, i.e. either when he enters insured employment or registers for the first time with the employment office as a job-seeker. The insurance number consists of from one to six digits and a prefix letter which identifies the Region of first registration.

Numbers are issued in sequence and are taken from a block assigned to the local office.

The employer deducts the employee's share of contributions from his earnings in each pay period, and at the end of the year provides the Commission with a record of contributions paid on behalf of each employee.

Where an employee works a full working week (which may be from 4 to 6 days, depending on the work schedule), a weekly contribution is required. When a person does not work a full working week, then a daily contribution at one-sixth the weekly rate is payable in respect of him for each day worked. Contributions are required for vacations, sick leave or other leave with pay, but not for periods of absence from work without pay. Contribution records are maintained at the respective Regional Offices where they are available for reference in computation of claims.

APPENDIX III

Five percent sample

(a) Purpose of sample.

A continuous work history is maintained at the Bureau of Statistics for a five percent sample of persons coming within the purview of the Unemployment Insurance Act. This is achieved by assembling year to year contribution and benefit records for each sample person. The sample is kept up to date by including new sample persons as they are added to the insured working body. Continuity is achieved by maintaining the cumulative employment record of each worker in addition to his current experience.

Thus designed, the sample is a pertinent source of information concerning the income and expenditures of the Unemployment Insurance Fund; this is its primary function. At the same time, it has obvious value for studies of employment and earnings patterns in the general field of labour statistics.

Since identification with the scheme is by insurance number, the method of sampling is based on that number, a five percent sample being obtained by selecting those having insurance numbers ending with 14, 34, 54, 74 and 94.

(b) Procedure for collection of sample data.

The administrative procedures for registering new employees and for recording contributions and benefit make provision for sampling. For example, a person entering insured employment for the first time is required to complete an Application for Insurance book (see exhibit 1, appendix VI), which local offices forward to the Head Office of the Unemployment Insurance Commission. If the insurance number assigned is a sample number Head Office prepares a copy which is forwarded to the Bureau of Statistics. This form provides the basic information necessary to set up a ledger card (exhibit 2, appendix VI), i.e., the name, sex, year of birth, occupation, industry and local office of the insured person. Another form (exhibit 3, appendix VI,) is received after the annual book renewal, at April 1 each year, which supplies information on the mobility of the employee, as to occupation, industry or location.

A third form (exhibit 4, appendix VI) is completed annually at the Regional Office in conjunc-

tion with the processing and filing of contribution records. This form contains a record of the number of days and the amount of contributions which are on record in the Regional Offices for the year just ended, one form being prepared for each sample person.

Information from these sources is assembled onto a punch card (exhibit 5, appendix VI), one for each sample person, and machine calculations are made on the basis of tabulation requirements. The individual's complete record for the year is transferred to his ledger card by means of a facsimile posting machine.

(c) Representativeness of the sample.

Substantial differences exist in the sex composition of the working force, in the level of employment and of earnings as between the several Regions across Canada. In selecting the sample, it was essential that these variables have a probability of occurring in the sample proportionate to their frequency in the universe. The digital sampling (with the prefix letter denoting the Region as an integral part of the insurance number), ensures adequate representation in this regard, and since there is no discrimination in the issuance of insurance numbers on the part of local offices, there is no reason to expect a bias with respect to industry, occupation or sex. It is thus probable that the several segments and classes of insured persons in different areas are proportionately represented in the sample.

(d) Reliability of estimates.

The estimates are subject to sampling error. As a rough approximation it can be said that 95% of the estimates given here will not be in error by more than an amount equal to nine times the square root of the estimate itself. Thus an estimate of size 400 will indicate that the true figure probably lies between 220 and 580 while an estimate of size 40,000 indicates, with probability of 95/100 that the true figure lies within the range 38,200 to 41,800. Estimates of larger magnitude, such as group totals, will have errors which are relatively smaller than the foregoing, and grand totals are estimated with negligible error.

APPENDIX IV

Explanation of terms

Contributors: persons for whom contributions were recorded during the year.

Average weekly rate of earnings: a weighted average earnings corresponding to the weighted average weekly contribution calculated on the basis

of the number of days and amount of contributions over the whole year. The average contribution thus calculated is a function of the pattern of recorded employment and earnings over the year, since movement from one earnings range to another would be reflected by a change in the daily contribution rate.

In determining the average rate, fractions of a cent less than one-half were disregarded while fractions equal to or greater than one-half were taken as a full cent.

Average duration of recorded employment: the average number of days (converted to weeks by dividing by 6) for which contributions were recorded during the year. This average thus represents only the insurable portion of employment, any employment engaged in by these persons which was outside the scope of the Unemployment Insurance Act not being included.

New entrants: those contributors whose application for an insurance number was made during the year.

Renewals: those contributors whose application for an insurance number was made at some time prior to the year in which they are classed as renewals. Re-entrants into insurable employment are included in this category (also referred to as "revivals").

Annual average weeks contributed: an annual pattern of recorded employment since entry into insurable employment. It is thus a function of two factors: a) the time under insurance, taken as from the date of entry into insurable employment and b) the total number of days contributed over that entire period. The result is no indication of the actual number of weeks worked in nor of the total exposure to insured employment, but is rather an expression of annual participation in insurable employment, being the ratio between the total exposure to insured employment and the total days contributed during that time, expressed in terms of a year. For example, a record might consist of 1,800 days over a period of 120 months; this represents 15 days per month. To express this average in weeks per year, it is necessary to multiply by 12 (months) and divide by 6 (days per week); this operation is simplified by multiplying by two, the equivalent of the fraction 12/6. The net result is 30 weeks per year, meaning that over the years since this person entered insurable employment, he contributed on an average 30 weeks per year.

APPENDIX V

Coverage as of 1941, and major changes from 1941-1954

Effective July 1, 1941, the Unemployment Insurance Act applied to all persons employed under a contract of service or apprenticeship, the main exceptions being: workers in agriculture and forestry, fishing, lumbering and logging, transportation by air or water, stevedoring, private domestic service, employment in a hospital not carried on for gain, and workers earning more than \$2,000 per annum. Young persons under 16 years and those whose earnings were less than 90 cents per day accumulated benefit rights at no cost to themselves (employer-employee contributions paid by employer) but were not permitted to draw benefit.

Since July 1941, the following major amendments have occurred:

January 7, 1942: an order-in-council was passed whereby persons whose earnings exceeded \$2,000 a year for reasons due to the war were permitted to retain insured status; hourly paid workers were also included in this ceiling change if their basic rate did not exceed 90 cents an hour.

September 1, 1943: wage ceiling was removed entirely for persons paid on an hourly, daily, weekly piece or mileage rate and raised to \$2,400 for persons on salary or commission.

September 1, 1943: employment in connection with a public utility, whether or not municipally

owned or operated, is insured, regardless of the permanent nature of the employment. Formerly, this type of employment, if operated in connection with a municipality, was subject to exemption when certified as permanent in character.

August 1, 1945: coverage extended to employment in "Transportation by Air".

September 3, 1945: coverage extended to professional nurses, other than on private duty.

August 1, 1946: coverage extended to employment in "lumbering and logging" in the province of British Columbia.

October 1, 1946: coverage was extended to employment in "Transportation by Water".

October 1, 1946: insured persons paid at weekly rate excluded from coverage where earnings exceed \$3,120.

January 1, 1948: insured persons paid at weekly or other salary rate or by commission excluded from coverage where earnings exceed \$3,120.

April 1, 1948: coverage extended to stevedoring.

April 1, 1949: Newfoundland entered confederation.

April 1, 1950: coverage extended to employment in "lumbering and logging" elsewhere than British Columbia.

July 3, 1950: wage ceiling raised to \$4,800.

APPENDIX VI

Questionnaires, ledger and punch card

Exhibit 1 — application for insurance book.

2 — sample ledger — record of insured employment and of contributions.

3 — sample questionnaire covering book renewal.

4 — sample contribution record, form 699A.

5 — sample punch card — contribution.

6 — form 409C, adjustment to registration of insured persons (used to report basic changes affecting sample persons, e.g., change of insurance number, of name, etc.).
