Physical Volume of Inventories

These data show the changes in quantities of goods held in inventories in a number of industries. Though shown as estimated dollar values these are dollars of constant prices and do not include the effects of price changes. Since they cover only part of the stocks held by manufacturing and mining firms they do not show what is happening to the total physical volume of stocks in these industries.

The series is the result of an effort to combine all available data on stocks of goods held by manufacturing and mining firms. Because this information has been collected for many different reasons the total does NOT give a complete or true picture of the movement of total manufacturing inventories. For example it includes no stocks in such important industries as textiles or iron and steel. But it does show changes in the volume of stocks held in a number of important parts of the manufacturing field. When, as in 1948, data on the dollar value of inventories include a large element of price change, some measure of what is happening to the quantity of goods held in inventory is very important.

The table headings show both the industry in which the stocks are held and the principal goods included in the series shown. Where the goods covered by this report are almost all of the total inventory in the industry, the series has been marked by an astrisk. In all other industries only part of the inventory is included. Changes in this part may not be the same as changes in the total inventory for these industries.

The goods were valued at 1944 cost prices. Showing the information in the form of dollars at constant prices makes it possible to judge the importance of goods held in different groups of industries. Those who prefer indexes of volume can convert these totals to index form and this has been done for the total.

Another table provides data on the ratio of stocks to shipments in these industries. This ratio gives the number of the current month's shipments which are held in stocks at the end of each month. It enables some judgment to be made as to whether stocks are increasing or decreasing in relation to the current rate of activity in the industry. In one instance, for sugar refineries, it has been found convenient to report this ratio in terms of weeks rather than months. For three of the industries shipments' data were not available or could not be conveniently used so data on raw material consumption was used for the ratio. This was true for rubber, meat packing, and pulp and paper.

This report was prepared by Mr. C. L. Barber with the assistance of Mr. J. B. Bergevin.
