The Quantity of Manufacturing Production in Canada

1923-1929

Published by Authority of the Hon. H. H. Stevens, M.P., Minister of Trade and Commerce

OTTAWA F. A. ACLAND PRINTER TO THE KING'S MOST EXCELLENT MAJESTY 1932

PREFACE

June

The present publication embodies the results of an investigation intended to satisfy a long-felt need for a measure of the trend of the physical volume, that is, the quantity, of manufacturing production in Canada in recent years. While the value of manufacturing production has been made available through the Annual Census of Manufactures for each of the years from 1917 to 1929, the great fluctuations in prices during this period have obscured what is, from many points of view, the most important subject of investigation in this field the quantity of manufacturing production and the rate at which that quantity tends to increase from year to year. For it is, after all, the quantity rather than the value of production that satisfies human needs. Again, it is of the highest importance that the quantity of production shall increase at a more rapid rate than the increase of the population, if the individual citizen is to be better off in the future than in the present. The tables of this report show very considerable progress in total quantity production and in quantity production per wage-carner in the period under review.

The study covers the production of the seven years from 1923 to 1929, when the manufacturing industries of the Dominion were generally expanding. The middle year of this period, 1926, was chosen as affording a normal and representative base for the index. Next, the different industries were weighted according to the value added by manufacture in those industries in 1926, as indicating their relative importance. Then the quantity of each product of each industry was secured and their relative importance calculated for the base year and for the other years covered. In certain cases where no quantities were available, the quantity of raw materials used or the number of wage-carners employed was used as a substitute. While this necessarily involved a certain amount of estimate, it is felt that the results for the different manufacturing industries and for manufactures as a whole attain a high degree of accuracy.

The period covered by this analysis, it is true, was one of rapidly increasing quantities as well as values of production. The usefulness of the index will be even more clearly apparent when the method is applied to the manufacturing production of 1930 and 1931. Then in all probability it will be found that the anticipated declines in the money value of production in most industries, as the result of the general fall of prices, will not mean a corresponding reduction in the quantity of manufactured products available for domestic consumption or for export. Thus the new index will do away with many misconceptions and contribute materially toward a better understanding of the position of the manufacturing industries in the national economy.

Special characteristics of the Central Electric Stations industry made it impossible to deal with it in the main body of the report, but a short Appendix shows the remarkable increase in the units (kilowatt hours) generated during the period under review.

This analysis of the volume of the manufacturing production of the Dominion and the preparation of the index was carried out by Mr. A. Cohen, B.Com., Acting Chief of the Census of Manufactures.

R. H. COATS,

Dominion Statistician.

THE QUANTITY OF MANUFACTURING PRODUCTION IN CANADA, 1923-1929

Importance of the Index

The ever-increasing use of factory products for satisfying the needs of mankind is the most significant feature of modern economic life. The inclusiveness of factory production at the present time is indeed extraordinary. It is not so long ago since Canadian manufacturing was carried on in the household for the immediate use of the family. With the coming of the industrial revolution production rapidly passed from the household to the factory where power-using machinery could be utilized to the best advantage. Nor has this process of transition slackened in any way. Each year sees an increasing number of articles which were formerly produced in the home become products of large and modern factories. In all industrial countries, hand-spinning and weaving to-day are lost arts. The foundry has displaced the blacksmith, and the shoe factory the local cobbler with his modest outfit. Even the farmer's butter churn is being displaced by the creamery and the country housewife depends increasingly on the village store for supplies which heretofore were the exclusive product of the home. The increasing variety of foods prepared in factories illustrates the tendency to increased reliance upon the factory for the satisfaction of our wants. To-day it is possible to obtain over the counter almost any kind of food prepared in factorics and ready for immediate use. Fresh vegetables are about the only staple articles which reach the consumer without, in some way, being first fashioned at the factory. Not only the food we eat, but also the clothing we wear, the household conveniences we use, our instruments of transportation and production are all factory products. The increasing volume of factory production, therefore, measures approximately the total flow of the economic goods upon which our modern life so vitally depends.

The statistics of manufactures compiled by the Dominion Bureau of Statistics each year afford a variety of measures of the growth of factory production. Number of wage-earners, capital invested, value of production and value added by manufacture, all show to some extent the direction and volume of growth. The question is, which one of these measures is most representative. The value of production, for example, being reported in dollars, does not disclose unequivocally the amount of change, since the values shown are the result of two variables, the value of money and the quantity of goods produced. Since

42791-21

MANUFACTURING PRODUCTION, 1923-29

real income is ultimately measured in goods and services, the growth of the volume of manufactures, as distinguished from the value, therefore, becomes a matter of great importance. The important thing to know is whether consumers are getting more goods and services, not whether they are expending more dollars and cents. If the value of money did not change or were subject only to slight changes, it would still be possible to measure the relative change in industrial output, even though the data were reported in monetary terms. But the value of money never stays at the same level for any considerable length of time and at times is even subject to violent fluctuations. Thus the violent price changes accompanying the depressions of 1921 and 1930 have made the monetary unit an uncertain measure of economic progress. Changes in the value of manufactured products tend to obscure the facts regarding alterations in the physical flow of goods from producer to consumer. It is the purpose of the present volume to ascertain the growth of manufactures, based on the volume of goods produced. Statistics now compiled fail to give a complete picture of the growth of manufactures as the following example shows :---

	Unit	1923	1929	Percent- age variation
Value of production	\$	154,895,991	181,148,689	+16.9
Value added by manufacture	\$	26,422,932	30,342,024	+14.8
Capital invested	\$	60,556,587	67,773,534	+11.9
Wage-earners	No.	5,500	5,408	- 1.7
Wheat flour produced	Bbl.	19,075,814	19,756,422	+ 3.6
Index of the volume of production* (1926=100)		97 - 9	$103 \cdot 7$	+ 5.9

Growth of t	the Mil	ing Ind	lustry,	1923-29
-------------	---------	---------	---------	---------

*Index includes products other than wheat flour.

As may be seen, the value of production increased in these six years 16.9 p.c. while the volume increased only 5.9 p.c. The greater increase in the value than in the volume is accounted for largely by the higher price of flour, which rose from an average of \$5.37 per barrel in 1923 to \$5.80 in 1929. It may also be noted that in spite of an increase of 5.9 p.c. in the volume of production, there was a drop of 1.7 p.c. in the number of wage-carners employed. This, no doubt, is due to increased efficiency and improvements in the equipment employed. From the above example, it may readily be seen that an index of the physical volume of production becomes a very important supplement to the statistics already collected in analysing the trend and development of industry.

Difficulties in Constructing the Index

The difficulties encountered in constructing an index of the volume of production, make it, at its best, a somewhat imperfect instrument for measuring the growth of industry. In modern production there is a tendency toward the more elaborate fabrication of raw materials. In one sense this is an element in the growth of manufacture, but unfortunately, it is not subject to statistical measurement. Even if it were possible to obtain quantitative data for all products manufactured, the resulting index would still understate to some extent the change in manufacture, as no recognition can be given to the changes in the quality of the products made. In constructing an index for the shoe industry, for example, account is only taken of the number of shoes produced. No reckoning can be made of the change in their quality. A shoe made to-day may be of superior workmanship and require more labour for its production than was the case, say, five years ago, yet an increase of 50 p.c. in the number of shoes produced is considered as a 50 p.c. increase in its volume, irrespective of the change in quality. It is quite obvious that in order to construct a true index of production, account should be taken of the change in the quality as well as the quantity. It is therefore, essential to recognize at the outset that data showing the volume of products manufactured are more likely to understate than overstate the growth of manufactured output.

The paueity of quantitative data was another difficulty encountered in constructing the index. For the larger staple industries the data are quite complete and the resulting index is consequently very reliable. For some of the smaller industries and even some of the larger industries, however, the opposite is true. Even in cases where the quantitative data were available, the large number of articles produced and the wide fluctuations from year to year made the construction of the index a matter of extreme difficulty. Where the quantitative data of the articles produced were not available, the quantities of raw materials used formed the basis of the index. And in those industries where quantitative data were not available for either the products made or the raw materials used, the change in the number of wage-earners was taken as the change in the volume of production.

In some cases a third difficulty appeared—the difficulty of combining relatives that fluctuate widely from year to year, as the following example shows:—

	Weight	Unit	1926	1927	Percentage variation
Phonographs	8	No.	100	40	$-60 \ge 8 = -480$
Radios	2	No.	10	70	$+600 \times 2 = +1200$
Total for industry .	10				$+720 \div 10 = 72$

The increase in the volume amounted to 72 p.e.; an increase of 60 radios and a decrease of 60 phonographs. If in this case it is found that the number of wage-earners increased only 10 p.e., it is therefore quite obvious that the large increase in volume is due to the error produced in combining relatives that fluctuate widely. In all such cases, therefore, adjustments were made to bring the index in agreement with the change in the number of wage-earners employed.

It is hardly necessary to urge that caution must be employed in comparing changes in the volume of production with changes in the number of wage-carners. Among different industries at the same time and in the same industry at different times, the number of wageearners employed may be no criterion of the differences in the physical volume of production. In some industries machinery is used more extensively than in others. Labour counts for far more in the manufacture of shoes than in the production of cotton cloth. The introduction of new machinery and labour-saying devices in a given industry may radically alter the relation between wage-earners and the volume of the output. In the tobacco industry, for example, due to the substitution of machinery for hand labour, the number of wageearners employed dropped from 7,319 in 1923 to 7,094 in 1928, a decrease of $3 \cdot 1$ p.e., while the volume of production rose from $81 \cdot 3$ to 120.7, an increase of 48.4 p.c. Nevertheless, it is reasonable to suppose that for broad groups of industries and for most industries for shorter periods of time, there is a high degree of correlation between the number of wage-earners employed and the physical volume of production. Even in industries where machinery is displacing hand labour, the volume of production must ultimately follow the changes in the number of wage-earners, for as soon as the change from hand labour to machinery is completed, increased volume can only be obtained through an increase in the labour force. In the average number of wage-earners reported annually to the Dominion Bureau of Statistics, we have, therefore, a possible basis for estimating the change in manufacturing output.

Records of the number of wage-earners may also be regarded as more likely to understate than overstate the changes in the volume of production. As stated previously, the tendency is toward increasing production per wage-earner through greater efficiency and increased use of machinery and labour-saving devices. Also in times of depression, many establishments follow the practice of keeping the wage-earners on the pay-roll on a part time basis rather than laying some of them off and employing the rest on full time, while in periods of increased industrial activity, the additional output required is secured through overtime work rather than an increase in the number of wage-earners. The net result of this is to confine fluctuations in the number of wage-earners within narrower limits than that of the physical volume of production. All things considered, however, the average number of wage-earners is materially influenced by the fluctuations in industrial activity.

Description of the Index

The data used in constructing the index are taken from the industrial statistics compiled by the Bureau. The index itself is modelled on the lines of the Harvard Census Index. The index is built up by a process of integration. First, the relatives of the products of each industry are combined to form industry indices; these industry indices are in turn combined to form group indices (component raw material or purpose classification, see Tables 1 and 2), and these group indices are then combined to form the index of manufacturing in general. The following short description of the index will convey a general idea of its nature.

The index is a weighted geometric mean of relatives with 1926 as the base.

The weights of the industries are computed in terms of percentages of the whole and are then multiplied by 10, the total weights equalling 1000.

Weights for industries and groups of industries are based on the value added by manufacture in 1926.

Weights for individual products within an industry are based on their value of production in 1926—figures for value added by manufacture not being available. Each product is weighted in accordance with its importance as measured by its value of production.

In order to secure a reliable measure of the change in the volume of production, it is necessary that the relatives of individual products as well as of each industry be weighted in accordance with the value of their contribution to the total result. The advantages of using figures for values added by manufacture as the basis of weighting are as follows:—

(a) Figures for values added provide the most satisfactory basis of weighting available since they represent the actual contribution of labour, capital and organizing ability to the production of commodities.

(b) These figures reflect to some extent the tendency toward the more elaborate fabrication of raw materials.

(c) Fluctuations in the value added are not as marked as those of gross value of production or of capital invested.

(d) There is a high degree of correlation between values added and number of wage-earners as well as between salaries and wages paid.

As mentioned above, geometric averages were employed in combining the relatives to form the index. This procedure offers two distinct advantages.

(a) The geometric average is less affected by extreme variations than the arithmetic average. It is therefore slightly lower than the arithmetic average.

(b) The base can be shifted with mathematical accuracy by a short method, a process which is impossible in the case of the arithmetic average.

Against these two advantages, the geometric mean has a disadvantage in that logarithms must be employed in its computation.

Construction of the Index

As mentioned above, the weight of all the products manufactured is taken as 1000, while the weights of each of the nine groups into which the manufacturing industries are classified are in proportion to their value added by manufacture, as the following table shows:—

Group ·	Value added by manu- facture, 1926	Percent- age of whole	Weight
	\$		
Total, All Groups	1,403.711,306	100.0	1.000
Vegetable Products	244.004.302	17.4	174
Animal Products	122,920,658	8.8	88
Textiles and Textile Products	163,502,261	11.6	116
Wood and Paper	339,062,685	24.2	242
Iron and Steel	247,168,476	17.6	176
Non-ferrous Metals	92.888.719	6.6	66
Non-metallic Minerals	91,863,604	6.5	65
Chemicals and Allied Products	62,464,944	4.5	45
Miscellaneous Industries	39,835,657	2.8	28

Computation of the Weight of Each Group, 1926

The next step is to calculate the weights of the industries composing the groups. The table below illustrates the procedure followed.

Computation	of the	Weights	for the	Industries	Composing	the
	Vege	table Pro	oducts (Group, 1926		

Industries	Value added by manu- facture, 1926	Percent- age of whole	Weight
Vegetable Products Group. Flour milling. Malt and malt mills. Rice mills. Bread and other bakery products. Biscuits, confectionery, cocea and chocolate Miscellaneous food industries. Starch, glucose, etc. Maearoni and vermicelli. Ice cream concs. Fruit and vegetable preparations. Coffee and spices. Sugar refining. Maple syrup and sugar. Syrups. Breweries. Distilleries. Wine and grape juice. Rubber. Tobacco. Linseed oil and oilcake. Miscellaneous vegetable products.	$\begin{array}{r} \$ \\ 244,004,302 \\ 25,675,291 \\ 1,837,401 \\ 175,327 \\ 29,991,944 \\ 27,075,786 \\ 4,457,409 \\ 1,789,857 \\ 600,137 \\ 305,861 \\ 13,019,755 \\ 3,209,337 \\ 15,422,180 \\ 157,016 \\ 110,196 \\ 29,154,450 \\ 8,540,709 \\ 1,135,349 \\ 36,665,948 \\ 42,596,610 \\ 1,122,560 \\ 1,021,179 \end{array}$	$\begin{array}{c} 17\cdot 40\\ 1\cdot 83\\ 0\cdot 13\\ 0\cdot 01\\ 2\cdot 15\\ 1\cdot 93\\ 0\cdot 32\\ 0\cdot 13\\ 0\cdot 04\\ 0\cdot 02\\ 0\cdot 93\\ 0\cdot 23\\ 1\cdot 10\\ 0\cdot 01\\ 0\cdot 01\\ 0\cdot 01\\ 0\cdot 01\\ 2\cdot 08\\ 0\cdot 61\\ 0\cdot 08\\ 2\cdot 61\\ 3\cdot 03\\ 0\cdot 08\\ 0\cdot 07\end{array}$	$\begin{array}{c} 174 \cdot 0 \\ 18 \cdot 3 \\ 1 \cdot 3 \\ 0 \cdot 1 \\ 21 \cdot 5 \\ 19 \cdot 3 \\ 3 \cdot 2 \\ 1 \cdot 3 \\ 0 \cdot 4 \\ 0 \cdot 2 \\ 9 \cdot 3 \\ 2 \cdot 3 \\ 11 \cdot 0 \\ 0 \cdot 1 \\ 0 \cdot 1 \\ 0 \cdot 1 \\ 20 \cdot 8 \\ 6 \cdot 1 \\ 0 \cdot 8 \\ 26 \cdot 1 \\ 0 \cdot 8 \\ 26 \cdot 1 \\ 0 \cdot 8 \\ 26 \cdot 1 \\ 0 \cdot 8 \\ 0 \cdot 7 \end{array}$

After weights have been assigned to all the industries the weights of the products used in the construction of the index for each industry are next calculated. The flour-milling industry may be used to illustrate the method followed to determine the weights of the products composing the index. It should be mentioned here, that the weight of each product is in proportion to its gross value of production, since figures for value added by manufacture are not available for individual products.

Products	Unit	Quantity	Value	Weight
			\$	
Wheat flour	bbl.	19,056,112		$13 \cdot 1$
Chopped grain feed	ton	843,148		2.9
Shorts and middlings		371,999	- , ,	1.0
Bran	46	[279, 429]	6,745,584	0.7
Rolled oats	bbL	758,243	5,634,759	0.6
	180 lbs.			
Total value of products included in index			182,781,529	18.3

Flour-milling Industry: - Computation of Weights for Each Product, 1926

On referring to Table 1, it is found that the flour milling industry has been assigned a weight of $18 \cdot 3$. This has to be distributed among the products in proportion to their value. The weight of wheat flour is determined by proportion as follows:—\$131,187,907 : \$182,781,529 : : x : $18 \cdot 3$.

 $\frac{131,187,907 \times 18 \cdot 3}{182,781,529} = 13 \cdot 1$

The weights of the other products are determined in the same way. After the weights of groups, industries and products are determined, the index is then constructed as shown below:—

Computation of Industry Indices

Products Unit	Weight	1926		1927		1928		
		Weight		Index	Number	Index	Number	Index
Flour Milling Ladus- try	bbl. ton	18 · 3 13 · 1 2 · 9 1 · 0 0 · 7 0 · 6	371,999 279,429	100.0 100.0 100.0 100.0	18,787,312 924,225 395,757 285,682	98.6 109.6 106.4 102.2	20, 389, 542 876, 128 448, 292 310, 694	$ \begin{array}{r} 107 \cdot 0 \\ 103 \cdot 9 \\ 120 \cdot 5 \\ 111 \cdot 2 \end{array} $

42791-3

Wood distillates and extracts	0.7	100.0	108.6	112.7

Computation of Group Indices

Computation of Index of General Manufactures

Groups	Weight	1926	1927	1928
All Manufacturing Industries	1,000	100.0	106.5	116.
Vegetable products	174	100.0	107.7	118.
Animal Products	88	100.0	97.7	100.
Textiles and Textile Products	116	100.0	107.4	114
Wood and Paper Products	242	100.0	107.7	118
Iron and Its Products	176	100.0	102.9	113
Non-ferrous Metals	66	100.0	115.4	128
Non-metallic Minerals	65	100.0	108.9	123
Chemicals and Allied Products	45	$100 \cdot 0$	106.7	117
Miscellaneous Products	28	100.0	110.5	109

In constructing the index of the flour-milling industry for 1927, it is found that wheat flour and rolled oats dropped to $98 \cdot 6$ p.c. and $85 \cdot 5$ p.c. respectively as compared with the base year 1926, while chopped grain feed rose to $109 \cdot 6$ p.c., shorts and middlings $106 \cdot 4$ p.c., and bran $102 \cdot 2$ p.c. These relatives are then combined according to their weights by means of geometric averages, as follows:

Relative		Weight											
98.6	x	131	-	log	98.6	x 1	31 :	-	1 • 99388	х	131		261.19828
109.6	x	29	=	66	$109 \cdot 6$	x	29 =	= 4	$2 \cdot 03981$	х	29		59.15449
106.4	х	10											20.26940
$102 \cdot 2$	х	7											14.06615
85.5	х	6	=	66	85.5	х	6 =	=]	1.93197	х	6	==	$11 \cdot 59182$
		183											366.28014
					366.2	801	4						

 $\frac{1}{183} = 2.00153$

On referring to the table of eommon logarithms, it is found that $2 \cdot 00153$ is the logarithm of $100 \cdot 4$, the figure which is taken as the index number of the flour milling industry for 1927.

In the same way, the indices of all the industries composing a group are calculated and then combined as illustrated above to find the index for the group. The group indices are in turn combined to get the index of manufactures in general. Tables 1 and 2 show the indices of each industry for the years 1923 to 1929 grouped according to the component raw material and purpose classifications.

Representativeness of the Index

Since it was not possible to obtain quantitative data for all the products made in each industry, it was therefore necessary to confine the index to a few broad series of products. Also, in some eases, the index was based on the raw materials used or on the number of wageearners employed. The reader is therefore urged to be eautious in making generalizations as to the growth of the volume of production. For many broad groups of industries the index is quite reliable, while for others it may be only relatively correct. In each ease, the reader should refer to Table 4, which shows the representativeness of the index for each industry as well as the basis on which it was constructed, whether the index is based on the raw materials used, the products made or the number of wage-earners employed. The table below summarizes the representativeness of the groups into which the industries are elassified.

Group	Weight	Value of products included in index, 1926	Total value of production, 1926	Percentage of total value of products included in index
		\$	\$	
Vegetable Products	174	622, 428, 703	668,890,914	93 - 1
Animal Products	88	410, 360, 192	444,686,105	92.3
Textiles and Textile Products	116	198,460,265	366, 334, 644	54-2

Representativeness of the Index

42791-31

From the above table, it may be seen that 71.1 p.c. of the value of the products made by Canadian manufacturers have been used in constructing the index. From the point of view of reliability, the vegetable products group takes first place with 93.1 p.c., followed by the animal products group with $92 \cdot 3$ p.c., non-metallic minerals $76 \cdot 2$ p.c., and so forth. In constructing the index of the non-ferrous metal group, only 19.2 p.c. of the value of the products were available. The reliability of the index is, however, far greater than this figure would indicate. In three industries of this group which produced about 54 p.c. of the total output, the raw materials consumed were used in constructing the index, while in two other industries the number of wage-earners employed formed the basis of the index. In some cases, the raw materials used may be just as representative as the quantities of articles manufactured in estimating the growth of an industry. The number of wage-earners employed, however, as has been shown above, has the tendency of underestimating the growth of manufactures. Taken all in all, the index for each broad group of industries shown in Tables 1 and 2 are quite reliable and may be used quite freely in making generalizations. In the case of some individual industries, however, the index must be used with caution; they should be used in conjunction with Table 4, which shows the reliability and basis of construction of the index for each industry.

THE GROWTH OF MANUFACTURES, 1923-29

The physical volume of production increased $50 \cdot 2$ p.c. between 1923 and 1929. When it is recalled that the population of Canada increased only $10 \cdot 8$ p.c. from 9,083,000 in 1923, to 10,068,000 in 1929, an increase of $50 \cdot 2$ p.c. in the volume of manufacturing production is indeed remarkable. Part of this advance was owing to an increase in the domestic demand due to an increased population and a rise in the standard of living, and part to the increased demand abroad for Canadian manufactured products, as the following table clearly shows:—

	1924	1930	Percentage increase or decrease
	\$	\$	
Raw materials	453, 521, 750	429,354.077	- 5.3
Partly manufactured goods	175,974,117	213,261,833	$+21 \cdot 2$
Fully manufactured goods	415,855,189	477, 642, 392	+14.9
Total	1,045,351,056	1,120,258,302	+ 7.2

Export of Canadian Products for the Fiscal Years Ending March 31, 1924 and 1930

On referring to the table next below, it may be seen that with the exception of a slight recession in 1924, the expansion was continuous. As might be expected, not all groups expanded to the same extent. The non-ferrous metal group led with an increase of $90 \cdot 3$ p.c., while the animal products group recorded the lowest increase, viz. $17 \cdot 2$ p.c. The slight recession in volume experienced in 1924 was not general. Textiles, wood and paper, iron and its products and non-metallic mineral products were the only groups affected. The textile and wood and paper groups recovered in the following year, while in the case of iron and its products and non-metallic minerals, the recovery was not complete until 1926.

Although this report covers only seven years, yet the general trend of Canadian manufacturing production as a whole is clearly shown. With the passing of time, the index of the volume of production will become more and more valuable in analysing the trend of production, both as regards the volume as well as the substitution of one product for another.

Growth of the Volume of Production

	1000	200

1923 = 100

*Weights are based on value added by manufacture in 1926.

Vegetable Products .- The most significant feature of the growth of the vegetable products group since 1923 is the great increase in the volume of alcoholic liquors, rubber goods and tobacco products, as compared with the moderate increases in the flour-milling and baking groups. All the major industries of the group experienced an increase in the volume of production in 1929 as compared with 1923, and only one large industry, viz., sugar-refining, had a decreased output since 1926. The increase in the volume of distilled liquors was the greatest of any large industry, the volume having increased by 455.3 p.c. since 1923. Fruit and vegetable preparations increased 121.4 p.c., rubber goods 89.1 p.c., beer and ale 61.9 p.c., and tobacco products $64 \cdot 0$ p.e. The increases in the volume of flour and bakery products, however, were not as substantial; the output of the bread and other bakery products industry advanced 24.6 p.c., while that of biscuits and confectionery increased 28.9 p.c., and of flour 5.9 p.c. The sugar-refining industry, although reporting an advance of 11.0 p.c. since 1923, nevertheless shows a drop of 18.2 p.c. in the volume of production since 1926. The table which follows gives the increase in the volume of production of all the industries of the vegetable products group since 1923 and 1926. The second column shows the increase since 1926 while the fourth column shows the increase since 1923.

Increase in the Volume of Production, Vegetable Products Group, 1923-1929

*1926 = 100.

Animal Products.—According to the table below, the output of the animal products group in 1929 was 17.2 p.e. greater than in 1923 and 4.6 p.c. lower than in 1926. The output of this group did not keep pace with that of other lines of production; indeed, this group reported the smallest increase of any. This was mainly due to a decline since 1926 in the output of three of the larger industries producing food products, viz. slaughtering and meat-packing, butter and cheese, and fish-curing and packing. These industries, despite decreased production since 1926, have nevertheless recorded slight increases for the seven-year period under review. The decline in the volume of production since 1926 was not general; the industries manufacturing wearing apparel recorded substantial increases. The decrease in the food group should not, however, be considered as changes in the domestie consumption of these articles, since a change in consumption is the result of three variables, i.e. home production, imports and exports. On referring to the export figures of animal products it is found that the reduced output of butter, cheese, meat, fish, etc., was due to the diminishing quantities of these articles exported and not to their decreased consumption in Canada. (On this point see also Canada Year Book 1931, p. 633.)

Industry	Weight	Index of volume of production* 1929 1923		Percentage increase since 1923

Increase in the Volume of Production, Animal Products Group, 1923-1929

*1926 = 100.

Textiles and Textile Products.—The volume of production of this group increased 33.8 p.c. since 1923; a figure which is materially lower than that of manufacturing in general, which increased 50.2p.c. Almost all the industries of this group manufactured a greater volume of products in 1929 than in 1923. The woollen cloth and corset industries were the only major industries to report a lower output. The rapid increase in the use of rayon in wearing apparel is one of the outstanding features of the changing fashious in dress during the past few years. This accounts for the unprecedented increase of 302.8 p.c. in the volume of production of the silk industry. The changing fashions in women's wear also affected the output of vet another industry, viz. the production of corsets, which declined steadily during the past few years. The change from cotton and wool to rayon fabrics did not, however, materially affect the output of cotton fabrics. The output of cotton varn and cloth was increased by 22.6 p.c. since 1923, and that of woollen yarus by 18.4 p.c., while the output of woollen cloth decreased 12.4 p.c. since 1923. The clothing group of industries, also increased substantially their output. Men's furnishing goods increased 34.4 p.c. since 1923, hosiery. knit goods and fabric gloves 32.8 p.e., women's factory clothing 31.7 p.c., men's factory clothing 17.0 p.c., hats and caps 69.8 p.c., oiled and waterproof clothing 83.4 p.c., while corsets decreased 6.4 The other industries employing textiles as their basic raw p.c. materials and producing articles other than clothing and cloth, also made considerable progress in increasing their volume of production, as the following table shows:-

Industry	Weight	Inde volur produ		Percentage increase since 1923	
		1929	1923	STRUCT 520

Increase in the Volume of Production, Textiles and Textile Products, 1923-1929

*1926 = 100.

[†]These two industries should be considered together since an establishment may be classified under one heading one year and under the other heading the following year, depending on the materials used.

Wood and Paper Products.—This group ranks third in importance as regards the gross value of production and total value of exports and first in importance as regards value added by manufacture and wage-earners employed. In 1929, the wood and paper products group produced $18 \cdot 6$ p.c. of the total output of all Canadian industries, employed $24 \cdot 4$ p.e. of all the wage-earners and contributed $22 \cdot 0$ p.c. of the total value added by manufacture.

The pulp and paper industry is the leading industry of the group. In 1929 there were 108 mills consuming about 5,280,000 cords of pulpwood during the year and employing hydro electric power to the extent of about 1,400,000 h.p. Canada now occupies first place among the countries of the world in the production of newsprint. This group supplies some of the leading articles entering into the export trade of Canada. Of all the manufactured products exported from Canada, printing paper comes first, planks and boards third, and wood pulp fourth.

GROWTH OF VOLUME OF PRODUCTION

Products	Unit	Quantity	Value
Newsprint paper	Cwt. Bbl. M ft. Cwt.		

Leading Exports, Calendar Year 1929

The volume of production of this group, therefore, depends largely on the demand in foreign countries for wood and paper products. The volume since 1923 increased $53 \cdot 1$ p.c. All the industries in the group, with the exception of two, reported increased output in 1929 as compared with 1923. Sporting goods decreased by $16 \cdot 5$ p.c., and carriage and wagon materials by $46 \cdot 9$ p.c. The reduction in the output of sporting goods was no doubt due to increased importations and not to a decline in the domestic demand. The decrease in the volume of carriage and wagon materials no doubt reflects to some extent the change from horse-drawn to motor-driven vehicles. In this connection it is interesting to note that in spite of this change, the output of carriages, wagons and sleighs was $1 \cdot 4$ p.c. higher in 1929 than in 1923. The table below gives the growth of the volume of production of all the industries classified under wood and paper products.

Industry	Weight	Inde volur produc	ne of	Percentage increase

Increase in the Volume of Production, Wood and Paper Products-Con.

*1926 = 100.

Iron and its Products.—The industries engaged in the production of iron and its products were second in importance among the manufacturing industries of Canada. Of the total value of production 18.9 p.c. was credited to this group, while from the point of view of wage-earners employed and value added by manufacture, this group also ranked second with 19.7 p.c. and 18.8 p.c. respectively. In spite of an increase of 57.8 p.c. in the volume of production since 1923, the plants engaged in the production of iron and its products still supply only about two-thirds of the domestic demand, as the following figures for 1929 show:—

Production		\$738,012,980	
Imports		-342,480,427	1,080,493,407
Exports			4,808,986
Consumptie	on		1,075,684,421

The table below gives a list of the most important items of importation during the fiscal year ending March 31, 1930.

Machinery	\$69,117,528
Rolling mill products	61,894,114
Automobile parts	35,746,929
Automobiles	34,464,666
Farm implements	30,075,453
Engines and boilers	15, 146, 437

GROWTH OF VOLUME OF PRODUCTION

All of the industries of this group have reported substantial increases in the volume of production since 1923. For the group as a whole there was an increase of $57 \cdot 8$ p.c. The output of automobiles more than doubled itself since 1923, the number having increased by 124 \cdot 8 p.c. Pig iron, castings and forgings, machinery, railway rolling stock and sheet metal products were the other major industries to report substantial increases in the volume of production as the table following shows:—

Increase in the Volume of Production, Iron and Its Products, 1923-1929

Industry	Weight	Index of volume of production*		increase Percentage since 1923
		1929	1923	SHILL LOOD

*1926 = 100.

Non-Ferrous Metals.—The industries comprising this group reported an increase of 90.3 p.c. in the volume of production in 1929 over that of 1923. An increase of 165.2 p.c. in the production of electrical apparatus and supplies, 134.1 p.e. in aluminium products, 63.7 p.c. in brass and copper products and 46.8 p.e. in non-ferrous metal smelting and refining accounts for the fact that the production of manufactured commodities of this group increased more rapidly than any other group during the period under review.

The largest industry of the group is the manufacture of electrical apparatus and supplies, with a gross value of production in 1929 of \$113,796,002. The tremendous increase of $165 \cdot 2$ p.c. in the output of this industry is accounted for by the increasing use of electrical equipment for domestic and industrial purposes.

The second largest industry of this group as regards the value of production is that of smelting and refining of non-ferrous metals. This industry experienced a great boom during recent years. Due to the paueity of the data in constructing the index, however, the full development is not reflected by the index of the volume of production. The full effect of this expansion will no doubt be reflected in future years. The increasing use of aluminium in the manufacture of kitchen utensils and electrical transmission lines is also reflected in an increase of $134 \cdot 1$ p.c. in the output of the aluminium products industry.

Industry	Weight	Index volum produc 1929	ie of	Percentage increase since 1923
Non-Ferrous Metal Products. Aluminium products. Brass and copper products. Electrical apparatus and supplies. Lead, tin and zinc products. Miscellaneous non-ferrous metal products Non-ferrous metal smelting and refining Precious metal products.	$28 \cdot 0 \\ 1 \cdot 0 \\ 1 \cdot 0 \\ 24 \cdot 0$	$ \begin{array}{r} 173 \cdot 9 \\ 148 \cdot 6 \\ 148 \cdot 0 \\ 143 \cdot 2 \end{array} $	$72 \cdot 9 \\ 74 \cdot 3 \\ 90 \cdot 8 \\ 55 \cdot 8 \\ 49 \cdot 8 \\ 85 \cdot 1 \\ 90 \cdot 6 \\ 91 \cdot 8 \\$	$\begin{array}{c} 90 \cdot 3 \\ 134 \cdot 1 \\ 63 \cdot 7 \\ 165 \cdot 2 \\ 187 \cdot 6 \\ 19 \cdot 5 \\ 46 \cdot 8 \\ 11 \cdot 3 \end{array}$

Increase in the Volume of Production, Non-Ferrous Metal Products, 1923-1929

*1926 = 100.

Non-Metallic Minerals.—Considerable increases were also reported in the output of non-metallic mineral products in 1929 as compared with 1923. With the exception of the miscellaneous nonmetallic mineral products industry, all the other industries of the group increased their output during the period under review. This group is dominated by four large industries that produced in 1929 about 72 p.c. of the total value of production as shown below:—

Industry	Value of Production, 1929
	\$
Petroleum products Coke and gas. Cement Glass products	$\begin{array}{c} 99,408,314\\ 39,910,443\\ 19,337,235\\ 15,507,442 \end{array}$
Total for the four industries Total for the group	$174,163,434\\242,023,518$

The main feature of the growth of this group is the increase of $161 \cdot 8$ p.c. in the volume of petroleum products manufactured. This is a reflection of the increase in the number of motor vehicles as well as an increase in the demand of fuel oils for heating purposes. The increase of $40 \cdot 7$ p.c. in the output of the coke and gas industry was due to the increasing use of coke in house furnaces, the large demand for nitrates as fertilizers and the extended use of tar products. The

GROWTH OF VOLUME OF PRODUCTION

volume of cement produced also increased $62 \cdot 9$ p.c. since 1923. This reflects the increased activity of the construction industries, the value of construction contracts awarded having increased from \$314,254,300 in 1923 to \$576,651,800 in 1929, an increase of $83 \cdot 5$ p.c. The glass industry in Canada cannot supply the domestic demand, there being no plate or sheet glass manufactured. About 40 p.c. of the glass used in Canada must therefore be imported. The large increase in the value of glass and glass products imported into Canada, which rose from \$7,629,598 in 1923 to \$10,569,457 in 1929, no doubt accounts for the relatively small increase in the volume of production of this industry, viz. $16 \cdot 2$ p.c.

The following table gives the growth of all the industries of the group.

Increase in the Volume of Production, Non-Metallic Mineral Products, 1923-1929

*1926 = 100.

Chemicals and Allied Products.—Except for the wood distillation industry, which has suffered from the competition of synthetic products, the chemical industries of Canada have improved their position in recent years, the volume of production having increased $43 \cdot 3$ p.c. since 1923. The four largest industries which produce about two-thirds of the entire output of the chemical products group, have all reported increases in the volume of production. The volume of acids, alkalies, salts and compressed gases which comprise the largest industry of the group increased $73 \cdot 0$ p.c.; that of paints, pigments and varnishes $36 \cdot 2$ p.c.; soaps, washing compounds and toilet preparations $30 \cdot 3$ p.c., and medicinal and pharmaceutical preparations $25 \cdot 6$ p.c. It is interesting to note that in 1929 about 90 p.c. of the domestic demand for chemicals and allied products was supplied by Canadian industries as the following figures show:—

1000

*1926 = 100.

Miscellaneous Industries Group.—This group is composed of 23 unrelated industries producing a great variety of products. With a few notable exceptions, the majority of the industries of this group, reported increases in the volume of production. The output of the refrigerator industry dropped $68 \cdot 4$ p.c. since 1923, while that of the scientific and professional equipment industry dropped $24 \cdot 0$ p.c. The drop in the volume of refrigerators produced is due to the change from the ordinary to electrical refrigerators, with the result that their production is passing from the refrigerator industry to that of electrical apparatus and supplies. The table below gives the growth of all the industries comprising the group.

GROWTH OF VOLUME OF PRODUCTION

Industry	Weight	Inde volur produ	ne of	Percentage increase since 1923

Increase in the Volume of Production, Miscellaneous Industries, 1923-1929

*1926 = 100.

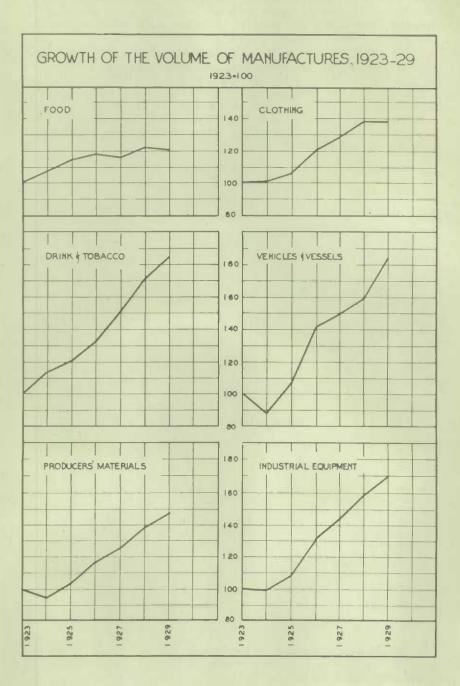

GROWTH OF THE VOLUME OF MANUFACTURING PRODUCTION ON THE PURPOSE CLASSIFICATION

The table below reveals some striking features of the growth of manufactures, viewed in accordance with the purpose of the principal products of each industry. For the period under review, the "drink and tobacco" and "vehicles and vessels" groups reported the largest gain in the volume of production, with increases of 84.9 p.c. and 84.3 p.c. respectively. Another notable feature revealed by the table is the moderate increase of 21.4 p.c. in the volume of food products manufactured in Canada since 1923, as compared with an increase of 50.2 p.c. for manufacturing in general. On analysing the industries composing the food products group several facts stand out preeminently. The output of fruit and vegetable preparations increased 121.4 n.c. This growth is indeed remarkable as it represents a corresponding increase in the domestic demand for these products, the foreign trade being relatively small as compared with the domestic production. Imports in 1929 were valued at \$7,608,426 and exports at \$2.841.734. Compared with this large increase in the volume of fruit and vegetable preparations there was an increase of only 21.8 p.c. in the volume of breadstuffs produced, 11.7 p.c. in the output of sugar, 10.6 p.c. in the production of butter, cheese and other milk products, and 8 p.c. in the output of the meat-packing industry. These figures do not, however, disclose the full increase in the domestic consumption of these items as their output is affected by the demand in foreign countries. The relatively small increase in the volume of production of food products is therefore due to decreased exportation. as the following table shows:---

Products	Unit	1923	1929
Sugar Butter Cheese Bacon and hams, shoulders and sides	cwt. \$ cwt. \$ cwt. \$ cwt. \$	$\begin{array}{c} 1,191,213\\ 12,023,173\\ 131,737\\ 4,905,608\\ 1,162,019\\ 23,445,401\\ 1,003,048\\ 18,947,005 \end{array}$	$\begin{array}{r} 285,310\\ 1,407,349\\ 14,004\\ 583,065\\ 929,461\\ 18,503,575\\ 287,727\\ 6,868,646\end{array}$

Exports of a S	Specified I	List of	Food Pr	oducts,	1923	and	1929
----------------	-------------	---------	---------	---------	------	-----	------

GROWTH OF VOLUME OF PRODUCTION

An increase of $74 \cdot 5$ p.c. in house furnishings and $69 \cdot 7$ p.c. in industrial equipment are some of the other outstanding features of the growth of the volume of production since 1923.

The table below reveals the slight depression in 1924, which did not, however, affect all industries. No depression was experienced by the food, clothing, drink and tobacco, house furnishings and miscellaneous groups. The output of the other five groups, however, was substantially lower. The books and stationery group, which includes printing and publishing and stationery and envelopes, was the hardest hit, the volume of production having dropped 16.6 p.c. as compared with 1923.

Growth of the Volume of Production, Purpose Classification

1923 = 100

Group	Weight	1929	1928	1927	1926	1925	1924	1923

In order to facilitate a more comprehensive view of the changes in the output of Canadian industry, the table below, which shows the rank of each group on the basis of the value of production in 1929, is given.

Group	Value of production, 1929 (in millions)	Percentage of whole
Food Clothing. Drink and tobacco. Personal utilities. House furnishings. Books and stationery. Vehicles and vessels. Producers' materials. Industrial equipment. Miscellaneous.		$\begin{array}{r} 21 \cdot 4 \\ 9 \cdot 3 \\ 5 \cdot 4 \\ 1 \cdot 5 \\ 2 \cdot 0 \\ 4 \cdot 0 \\ 10 \cdot 4 \\ 29 \cdot 5 \\ 15 \cdot 8 \\ 0 \cdot 7 \\ 100 \cdot 0 \end{array}$

Rank of Each Group, 1929

Details of the growth of each group and sub-group of all the industries, classified according to the purpose of the principal products, are given in Table 2.

GROWTH OF THE VOLUME OF PRODUCTION, BY PROVINCES

As stated previously, the number of wage-earners reported annually to the Dominion Bureau of Statistics furnishes a basis for estimating the changes in the volume of good produced. This measure does not, however, disclose the entire growth. For reasons which have already been explained, the number of wage-earners has a tendency to underestimate the growth of production. The following table, which verifies this contention, shows that the error is cumulative and that for the period under review there was an increasing deviation between the index of the volume of production and the index of the number of wage-earners. Between 1923 and 1929 the number of wage-earners increased by one-third, while the volume of production increased by one-half.

Year	Growth of the volume of production	Growth of the number of wage- earners	Index of volume of production per wage- earner
1923 1924	$ \begin{array}{c} 100 \cdot 0 \\ 98 \cdot 2 \end{array} $	$ \begin{array}{r} 100 \cdot 0 \\ 96 \cdot 4 \end{array} $	100·0 101·9
1925 1926 1927	$ \begin{array}{r} 107 \cdot 5 \\ 122 \cdot 2 \\ 130 \cdot 2 \end{array} $	$ \begin{array}{r} 104 \cdot 1 \\ 111 \cdot 6 \\ 119 \cdot 0 \end{array} $	$ \begin{array}{r} 103 \cdot 2 \\ 109 \cdot 5 \\ 109 \cdot 4 \end{array} $
1928. 1929.	$\begin{array}{c}150 \cdot 9\\150 \cdot 2\end{array}$	$126 \cdot 4$ $133 \cdot 5$	112·3 112·5

Comparison of the Growth of the Volume of Production and the Number of Wage-earners Employed

In view of the above facts, the table below, which has been prepared to show the growth of the volume of production in each province, has been estimated on the basis of the growth in the number of wagecarners employed, and the increase in the average volume of production per wage-earner.

The most remarkable fact revealed by this table is the increasing industrialization of the West. For the period under review the Western provinces have experienced a proportionately greater expansion than the two main manufacturing provinces of Ontario and Quebec. Saskatchewan reported the greatest development of any province with an increase of 126.1 p.c. in the volume of production.

MANUFACTURING PRODUCTION, 1923-29

Another significant fact is the failure of the Maritime provinces to keep pace with the rest of Canada. Nova Scotia and New Brunswick had an increased output of only $34 \cdot 0$ p.c. compared with $50 \cdot 2$ p.c. for the whole of Canada, while Prince Edward Island actually reported a reduction of $14 \cdot 8$ p.c. in the volume of production since 1923. The provinces of Ontario and Quebec which contribute respectively $51 \cdot 9$ p.c. and $28 \cdot 5$ p.c. of the total value of products manufactured in Canada in 1929, also reported remarkable increases of $48 \cdot 1$ p.c. and $47 \cdot 2$ p.c. respectively.

	Wage-earners employed		Percentage of wage-carners 1929 to

 1 The increased number of wage-earners in 1929 is multiplied by 9/8, the increased volume of production per wage-earner in 1929 as compared with 1923, as shown in the table on the preceding page.

² Exclusive of "Central Electric Stations."

GROWTH OF THE VOLUME OF PRODUCTION OF CENTRAL ELECTRIC STATIONS

Central Electric Stations although considered as a distinct industrial group in the Census of Manufactures have nevertheless been omitted in the index of the quantity of manufacturing production. Central Electric Stations are in many respects in a class by themselves. They use no raw materials with the result that the value added by manufacture is proportionately greater than in any other group. The animal products group, for example, employing 67,670 persons in 1929, reported a value added by manufacture of \$132,-409.973 as compared with a value added by manufacture of \$122,-883,446 by Central Electric Stations with an employment of only 16,164 persons. In capital invested this industry is also unparalleled. With a gross value of production of only \$122,883,446, the capital invested amounted to \$1,055,731,532 compared with a value of production of \$3,906,487,894 and a capital investment of \$4,027,283,222 for all the other industrial groups. In this industry, consequently, the main items of expenditure are for upkeep of plant and payment of interest charges on the huge capital investment.

As explained previously, the system of weighting adopted is based on the value added by manufacture (gross value of products less materials) in 1926. If Central Electric Stations were included in the index, it would have to be assigned a weight which would be far greater than its importance as an industrial group would justify. As a result of this, fluctuations in this group would be a disturbing factor in estimating the volume of manufacturing production. However, in order to give a comprehensive picture of manufacturing as a whole, the following table is included to show the development of Central Electric Stations since 1923.

Year	Wage- earners employed	Increase since 1923	K.W.H. generated	Increase since 1923
1923 1924 1925 1926 1927 1928 1929	No. 6,196 7,269 7,537 7,602 8,699 9,641 9,350	$\begin{array}{c} 17\cdot 3 \\ 21\cdot 6 \end{array}$	$\begin{array}{c} \text{thousands} \\ 8,099,192 \\ 9,315,277 \\ 10,110,459 \\ 12,093,445 \\ 14,549,099 \\ 16,337,804 \\ 17,962,515 \end{array}$	

Growth of Central Electric Stations, 1923 to 1929

INDEX OF WACT-BARNERS

Table 5.-Number of Wage-earners Employed in Each Industry and Percentage Variation, 1923-29-Concluded

T 1 ton	Number of wage-carners								Percentage variation						
Industry	1929	1928	1927	1926	1925	1924	1923	1929	1928	1927	1926	1925	1924	1923	
Recapitulation All industries	$32,242 \\ 27,456$	$\begin{array}{r} 71,974\\ 57,005\\ 103,973\\ 138,053\\ 104,397 \end{array}$	$\begin{array}{c} 67,398\\ 57,361\\ 98,708\\ 132,105\\ 92,677\\ 27,197\\ 22,975\\ 10,717\\ \end{array}$	$\begin{array}{r} 64,099\\56,944\\92,460\end{array}$	$\begin{array}{c} 53,457\\ 86,693\\ 110,662\\ 77,935\\ 22,600\\ 21,285\end{array}$	$\begin{array}{c} 56,266\\ 47,679\\ 82,364\\ 109,879\\ 66,912\\ 17,213\\ 21,196\\ 10,201\\ \end{array}$	$54,708 \\ 50,947 \\ 84,479$	$\begin{array}{c} 119\cdot 4\\ 100\cdot 1\\ 114\cdot 2\\ 123\cdot 5\\ 128\cdot 7\\ 132\cdot 8\\ 122\cdot 5\\ 116\cdot 1\end{array}$	$\begin{array}{c} 112 \cdot 3 \\ 100 \cdot 1 \\ 112 \cdot 5 \\ 118 \cdot 8 \\ 115 \cdot 5 \\ 118 \cdot 7 \\ 111 \cdot 6 \end{array}$	$\begin{array}{c} 105\cdot 1\\ 100\cdot 7\\ 106\cdot 8\\ 113\cdot 7\\ 102\cdot 5\\ 112\cdot 1\\ 102\cdot 5\\ 102\cdot 6\end{array}$	$ \begin{array}{r} 100 \cdot 0 \\ 100 \cdot 0 \\ 100 \cdot 0 \\ 100 \cdot 0 \end{array} $	$\begin{array}{c} 97 \cdot 1 \\ 93 \cdot 9 \\ 93 \cdot 8 \\ 95 \cdot 2 \\ 86 \cdot 2 \\ 93 \cdot 1 \\ 95 \cdot 0 \\ 95 \cdot 0 \\ 96 \cdot 9 \end{array}$	86-4 87-8 83-7 89-1 94-5 74-0 70-9 94-6 97-7 89-2	$ \begin{array}{r} 84 \cdot 4 \\ 70 \cdot 4 \\ 97 \cdot 3 \\ 104 \cdot 7 \end{array} $	

1926 = 100

¹ Statistics not available.

² Includes "abrasives" which has been separated in 1928.

³ Exclusive of "central electric stations."

* The large increase in the number of wage-carners since 1927 is due to the inclusion under this classification of firms engaged solely in blending and packing of tea which were not compiled previously.

* The increase in the number of wage-earners since 1925 is due mainly to the change in method adopted in calculating the average employment.

⁶ Included with "All other wood and paper industries."

7 Included with "all other industries."

⁸ Includes 840 wage-earners in the "signs" industry, now discontinued.

⁹ Matches included with "Miscellaneous Chemical Industries" since 1929.

INDEX OF WAGE-EARNERS
