Years of Ans
Eicellence dexcellence

## Data in Many Forms ...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

## How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

Client Services,
International Trade Division,

Statistics Canada, Ottawa, K1A 0T6 (Telephone: 951-9647) or to the Statistics Canada reference centre in:

| St. John's | $(772-4073)$ | Winnipeg | $(983-4020)$ |

## Highlights

January 1993 marked the fourth anniversary of the implementation of the Free Trade Agreement between Canada and the United States. The North American Free Trade Agreement was initialled in December 1992, and soon its provisions will be up to the legislatures of the three North American countries to ratify. There is debate about the effects of the original free trade agreement and speculation on future transformations in the patterns of North American production and trade.

For these reasons, Statistics Canada compiled a set of North American trade data to shed additional light on trade patterns within the region both before and after the signing of the accords. This publication reflects the results of this effort. The data offers two important advantages: merchandise trade figures are assigned to their industries of origin and combined with production data; and inconsistencies in the time series have been dealt with as well as existing information allows us to. The first of these features makes it possible to relate the figures contained within to a great number of economic variables, profits and employment among them. The second is a means of assuring users that comparisons between the situation arising in the late eighties and early nineties are possible.

The report indicates that:

- From 1981-83 to 1989-91, the supply of manufactures in the combined United States and Canadian market increased by almost one trillion dollars. Canada's share of the increase was just under 9 per cent. Given that its average share of the market was about 7 per cent, this indicates that Canadian industries gained share. In the second half of the period - from 1985-87 to 1989-91 - Canada's gain was larger as Canada accounted for 11 per cent of the market's increase.
- Canada lost share in its own market: from $66.8 \%$ in 1981-83 to $60.7 \%$ in 1985-87 and $59.3 \%$ in 1989-91. However, over the same periods, its share of the United States market rose from $1.9 \%$ to $2.3 \%$ and then $2.6 \%$. Given the larger size of the United States market, Canada's share in the combined market actually rose.
- Canada accounted for 4 per cent of the increase in the United States market, even though its average share of the market was closer to 2 per cent.
- The United States lost share in its own market: from $90.7 \%$ in 1981-83 to $86.7 \%$ in 1985-87 and $85.4 \%$ in 1989-91. However, its share of the Canadian market rose from $24.5 \%$ to $27.4 \%$ in 1985-87 and remained at that level in the latest period. Given the smaller size of the Canadian market, the increase did not offset the share losses in its own market.
- All other countries combined expanded their share of the increase in the combined market; in the Canadian market; and, in the United States market during both halves of the period reviewed. For the combined market for the period as a whole, their share accounted for more than 22 per cent of the increase, even though their market share was only about 10 per cent. In the second half, their share of the increase was lower - just under 18 per cent.
- Mexico's share of the United States market grew from $0.3 \%$ in 1981-83 to $0.5 \%$ in 1985-87 and $0.7 \%$ in 198991. Although $42.0 \%$ of United States imports from Canada overlap with goods imported from Mexico, much of the overlap appears to be incidental in nature.

## Introduction

## 1. Sources and Limitations

Over the last year, Statistics Canada has been involved in compiling a new data base designed to help understand recent changes in the patterns of merchandise trade between Canada and the United States. The data are derived from official sources - from Statistics Canada's records on Canadian trade and production, and from the United States Bureau of the Census for corresponding data for the United States.

The data base includes a number of novel features. Firstly, whereas merchandise trade statistics are normally broken down by commodity, the new data base aggregates them into their industries of origin. Secondly, the data base includes statistics on domestic production in Canada and in the United States broken down into the industries in which production originated. Thirdly, the data base also includes data on imports by the United States and Canada from third countries, and those imports are assigned to their industrial origins. And finally, the data base offers consistency of classification - both over time and between Canada and the United States - in spite of the fact that the source data were originally classified using different classification schemes.

There are limitations to the figures collected. The data base covers manufactured products only. While these account for over four-filths of all goods exported from Canada to the United States and almost three quarters of all goods and services exported to our neighbours, they obviously do not account for all trading transactions between the two countries. The assignment of exported manufactured goods to their industries of origin is more by analogy than as a result of direct observation. In fact, it is based on their production record and not on their export patterns. For example, if two industries produce the same good - two thirds of it produced by A and one third by B - but only A exports it to the United States, one third of the value of exports will be assigned to $B$. But the seriousness of this problem is greatly attenuated by the fact that manufactures are only broken down into twenty-two component industries. These are sufficiently broad not to be distorted by inappropriate assignments.

The information on the data base does not allow for the fact that in many instances exports do not take place immediately after production. In fact, exports may be mediated by wholesalers after being stored for some time. For this and other reasons, the data displayed in the tables and charts that follow are mostly in the form of three-year averages. These averages should remove most irregularities caused by lags between production and trade.

The data base does not extend further back than 1981. This is because earlier data cannot be placed on a comparable footing with those that form the base. But even for the period covered, there are discontinuities which must be brought to the user's notice. For example, in 1988 Canada discontinued the way it described and classified exported and imported goods. The traditional classification introduced in the early sixties was replaced by an internationally comparable system - the Harmonized System of Commodity Description and Coding. Moreover, the United States replaced its traditional classifications by the Harmonized System in 1989. The United States uses a system to classify its manufacturing industries which differs from its Canadian counterpart. It was only recently that the two countries agreed on an official concordance which lists the Canadian equivalents of United States industries and conversely. ${ }^{1}$ And finally, until 1988 in Canada and still currently in the United States, domestically produced goods use a different classification system from that used for international trade.

These inconsistencies place obvious constraints on any analysis of the figures that requires the use of comparable data over time and exact comparisons with the United States. The detail necessary to explain changes in detected patterns may simply not be available on the basis of existing official records. But, so long as analysis remains at the level of generality featured in Statistics Canada's data base, the figures are both consistent and comparable.

## 2. Data Presentation and Environmental Changes

Throughout the period under review (1981-1991) there were some profound changes that affected not only the two North American economies but also those of their trading partners. The period started with a short sharp recession that affected both Canada and the United States. The effects of the second oil shock marked the beginning of the period; the consequences of the Gulf crisis on oil prices marked its end. The last two years of the period covered were marked by another recession, seemingly shallower but more drawn out than its predecessor ten years earlier. The Free Trade Agreement involving the United States and Canada entered into effect in 1989. Receipts from Customs tariffs, as a share of trade, declined steadily during the decade.

The Canadian dollar entered the period trading at just over 0.80 of its U.S. counterpart; at mid-period it had dropped to a low of 0.72 ; but it reached a comparatively high value of 0.85 towards the end of the decade, and over 0.87 in 1991. The U.S. dollar, having entered the decade at a comparatively low value in comparison with the currencies of its major trading partners, reached record highs by 1985 but dropped again after the Louvre

[^0]agreement of February 1987. This was also a decade in the course of which - as the tables and charts included in this report show - the United States economy took in a progressively greater share of foreign produced goods and services. In fact, at the beginning of the decade, imports of goods and services accounted for $10.5 \%$ of GDP. In 1990, they had risen to a record high of $11.3 \%$ although falling off in 1991. But the intake of manufactured goods as a proportion of comparable goods manufactured in the United States rose from $9.0 \%$ in 1981 to 15.2 \% in 1991

#### Abstract

All data are expressed in current U.S. dollars and, where currency conversions were required, vatues were converted using the average official exchange rates. There were no serious alternatives to an analysis conductod in terms of current dollars. Conversion into constant dollars would require a wide range of matched (U.S. Canada and Othef countries) price indexes capable of deflating current values at the commodity level prior to their aggregation into industries. Such indexes do not exist. Those that do exist are only available at a relativety aggregated level and their application would introduce untold distortions in the data. For this reason, the option of using them was discarded.

Most of the data presented are in terms of shares imports from Canada into the United States as a share of imports from all origins; imports from Canada as a share of all goods available domestically in the United States; imports into Canada from the United States as a share of all goods available domestically, etc. - and changes in shares. The behaviour of shares helps detect patterns where changes in absolute values - affected as they are by so many other processes may obscure them.

#### Abstract

The use of shares and changes in shares entalls the use of specific terms and corresponding detinitions. For example, the expression 'total market share' denotes the ratio of the value of imports from one country to the sum of the value of imports from all countries plus the value of domestic production minus the value of exports. The expression import market share' implies the ratio of the value of imports from ane origin to the value of imports from at countries. The expression absolute change in share' denotes the difference $\left(S_{t}-S_{0}\right)$ between two shares ( S ) measured at different times. Its unit is percentage points. The expression "felative ctrange in market shares* denotes the relative difference $\left(S_{1} / S_{0}\right.$ - 1) *100) between two shares measured at different times and is expressed in per cent.

## 3. The Combined Market

The most important achievement in the compilation of the new data base and the starting point of any analysis of the statistics it includes is the so called "combined market". By combined market is understood the value of all goods produced by and made available in the United States and Canada (i.e. total shipments less exports) plus the value of all goods imported by both countries from all origins. The combined market is estimated for manufacturing as a whole and for each of its twenty-two standard industries. For each of these, the market is broken down according to whether it is Canada or the United States. For each market three suppliers are defined: Canada, the United States and all other countries. Accordingly, in Canada, the total supply of manufactured goods is made up of Canadian production that is not exported; imports of manufactures from the United States; and imports of manufactures from all other countries. The behaviour of these markets over the decade is the first topic to be featured in the report.

## 4. Measures of Relative Performance

There are several measures of relative performance. One is simply a measure, absolute or relative, of the change in share over a period of time. The relative change in share can be placed in the context of a simple accounting identity. For example, a change in the value of imports of a particular industry to a market over a period of time can be expressed as the joint result of the growth of the market, the growth of the supplies of that industry's goods within the market, and the growth of the imported component of that industry's supply over the same period of time. The third component is labelled "relative performance" and may be taken as a rough indicator of competitiveness in a market.

## 5. Structure of the Report

In addition to the introduction, the report consists of seven sections, including two which provide the methodology and the detailed tables. Each of the first five sections following the introduction is made up of a brief text outlining its major findings together with supporting charts and tables. The first section is an overview of trade in manufactures between Canada and the United States in 1981-91. This is followed by a more detailed review of the trading patterns for the United States market, by each of the standard twenty-two manufacturing industries. This review is supplemented by tables showing changes in the performance of imports of other origins in the U.S. market. The same kind of review applied to the Canadian market is featured in a third section.

The fourth section includes a number of miscellaneous findings, such as the relationships detected so far between reductions in tariff duties and changes in import shares; the relationship between changes in trading patterns and fluctuations in the exchange rate of the two dollars vis-a-vis each other and vis-a-vis the currencies of their major trading partners; and a number of validation tests to measure whether or not there are relationships between the performance of Canada and the United States in each other's market. The fifth section examines in greater detail the performance of Mexico in the U.S. market and examines the categories of trade in which both Mexico and Canada are active in the United States.

Section six provides a note on the methods used in deriving the data and on the limitations of the statistics. Finally, the report includes a seventh section with tables containing summary and detailed data. All data used for charts in the text are also provided. The tables should be used as reference and also as a basis to commission additional information from the data base.

## 6. Standards

There are a number of standard industrial and geographic breakdowns used in this report. The industrial breakdown is the standard two-digit breakdown of manufacturing industries provided by the Canadian Standard Industrial Classification - 1980 (SIC - 80). ${ }^{2}$ In the case of the United States, its Standard Industrial Classification categories are converted into Canadian equivalents using the official concordance between the two systems ${ }^{3}$. The geographic breakdown of North America's trading partners is that given in Statistics Canada's international trade publications, ${ }^{4}$ with the addition of two or three major countries for some of the continental or trading bloc categories. There is, however, considerable more detail underlying these categories and some of it is readily available on request. By and large, full geographic detail is available; industrial detail is available where the concordance between the two classifications is relatively straightforward. In more complex cases, confidential data may be involved and therefore the detail cannot be released.

[^1]
## Section 1

## Overview

## 1. General Setting

Over the last thirty years, Canadian exports of goods and services to the United States and United States exports of goods and services to Canada grew very fast. As a ratio to the two countries' GDP, the trend started at nearly $0.8 \%$ southbound and finished at roughly $1.9 \%$. The northbound trend ranged from $12.2 \%$ to $17.5 \%$ at the end. Table 1 below provides a quick view of the path that trade between the two countries has followed:

Table 1
Comparison between U.S. and Canadian bilateral trade in goods and services
Relationship of trade to GDP 1961-91
$\left.\begin{array}{llrrr}\hline & \begin{array}{r}\text { Annual } \\ \text { compound } \\ \text { rate of } \\ \text { growth }\end{array} & \begin{array}{r}\text { As } \\ \text { share } \\ \text { of GDP } \\ (1991)\end{array} & \begin{array}{r}\text { Max. } \\ \text { Share }\end{array} & \begin{array}{r}\text { Min. } \\ \text { Share }\end{array} \\ \text { and Year }\end{array}\right]$

* also 1988 and 1989

The pattern of growth was not uniform. In the case of northbound trade there have been several ups and downs. In contrast, southbound trade has been steadier but it too seemed to show a change in pattern towards the mideighties as it flattened out after almost twenty-six years of uninterrupted growth.

This report, however, is not about "goods and services". As yet there is no data base that can provide details for services that are as detailed as those for goods. Nor is the report about all goods. It excludes trade in unprocessed agricultural products, mineral ores and petroleum. These components are less significant in terms of the total and their fluctuations over time appear to be quite distinct from those that mark trade in manufactures.

## 2. Export and Import Propensities

The charts and tables below are an introduction to the changes in patterns of trade in manufactured goods between Canada and the United States witnessed in the last ten years. The charts show, for each of the two countries, two propensities: the average propensity to export to the other, measured as the ratio of exports to the other North American country to exponts to all destinations; and the average propensity to impont from the other country, measured as the ratio of imports from
the other North American country to domestic supply. The corresponding figures can be found in Table 7.4 of Section 7 on basic data. Specifically, Charts 1 - 4 compare each of the two North American countries' propensity to export to each other to their propensity to import from each other. The propensity to import is the same concept as the "total market share". Because trade in automobiles and related equipment looms so large in the countries' merchandise trade, the charts show both total trade in manufactures and trade after exclusion of the transportation equipment industry.

Chart 1
Canadian Propensity to Export to the United States Manufactured Goods

1 Canadian \$ in US funds

Chart 3
U.S. Propensity to Import from Canada Manufactured Goods

## Chart 2

U.S. Propensity to Export to Canada Manufactured Goods

Per cent (three year moving averages)

Chart 4
Canadian Propensity to Import from the U.S. Manufactured Goods

Per cent (three year moving averages)

In the last ten years, Canadian exports of manufactures to the United States as a share of all Canadian exports of manufactures climbed from 76 to 84 per cent and fell back to some 78 per cent (Chart 1). The share seems to have stabilized at that level: over the last three or so years, relatively little change is noticeable. Net of exports of transportation equipment, the profile is substantially the same, but lately the share has swung up.

Over the same period, U.S. manufactured exports to Canada as a proportion of total U.S. exports went through much the same pattern of change (Chart 2). However, net of transportation equipment, after dropping from 17.3 per cent in the mid-eighties to 16.0 per cent in 1988, exports showed a sharp comeback and have now peaked at almost 18 per cent.

Canadian manufactures as a proportion of U.S. domestic supply of manufactures resumed their gains in the U.S. market after slowing down between 1985 and 1987 (Chart 3). They have now reached a record share 2.6 per cent of all manufactures available for domestic consumption in the United States. The same pattern held for the shares of non-transportation manufactures.

United States manufactures have staged a comeback in the Canadian market, after a three year decline, between 1985 and 1988 (Chart 4). Currently, they have almost matched a peak share of 26.9 per cent reached in 1985. But non-transportation manufactures, after a brief hesitation in 1986, resumed growth at a faster rate and
their share moved from just under 18 per cent in 1986 to 21.0 per cent currently, another record.

## 3. Combined Market: an Overview

The tables that follow allow for a closer comparison of the aggregate data presented in Charts 1-4. They are also the starting point of the examination of industries' export performance featured in this report. They show how much each of the suppliers to the combined market (United States and Canada) shared in overall growth as compared to their share in the market. ${ }^{5}$

Table 2 shows the absolute changes in the value of manufactures supplied to Canada and to the United States over the period 1981-83 to 1989-91. These changes are broken down in two ways: values are shown for the period as a whole and for its latter half - 1985-87 to 1989-91; and suppliers are divided into Canada, United States and all other countries combined. The supply of

5 The following is the comparison: define $A$, as the value of a country's supply to the market at the end of the period and $A_{0}$ at the beginning; define $C_{1}$ as the value of total supply to the market at the end of the period and $C_{0}$ at the beginning. Define share in the market as $\left(A_{1}+A_{0} / C_{1}+C_{0}\right)^{+100}$ which is a measure of the supplier's share at half mark of the period concerned. Define share in change as $\left(A_{1}-A_{0} / C_{1}-C_{0}\right)+100$. The relation between these two ratios is an indicator of the extent to which the supplier has gained or lost share in a particular market.

Table 2

Figures in italics - per cent
manufactures is defined as the sum of the production of manufactures in Canada and the United States plus their respective imports of manufactures from all origins minus their respective exports of manufactures to all destinations. Comparable figures for each of the twentytwo industries, as well as detail on imports by individual countries and country groupings are provided in Section 7.

The values of all manufactures are expressed in U.S. dollars to allow for the two markets to be combined. Prevailing exchange rates were applied to values originally determined in Canadian dollars. Some of the results arrived at are sensitive to the currency in which the underlying data are expressed. In fact, if shown in Canadian dollars, these results show bigger gains of share for Canada.

The following are the principal conclusions drawn from the table:

- Over the entire period, the supply of manufactures in the combined market increased by almost one trillion dollars. Canada's share of the increase was just under 9 per cent; its average share of the market was about 7 per cent. Accordingly, Canada's share in the total supply of manufactures to the combined market increased.
- Canada's gain of $\$ 87$ billion in the combined market was made up of $\$ 49$ billion at home and $\$ 38$ billion in the United States. The latter represented almost 44 per cent of the total gain. In fact, Canada accounted for 4 per cent of the increase in the U.S. market, even though its average share of the market was closer to 2 per cent.
- In the period 1985-87 to 1989-91, the combined U.S.Canada market increased by $\$ 506$ billion or 19 per cent. Canada took 11 per cent of the increase ( $\$ 56$ out of $\$ 506$ billion), even though its share of the market at the beginning of the period was only 6.6 per cent.
- One third of Canada's gain in the combined market in the second half of the period derived from its performance in the United States market.
- Relative to their average share, all other countries combined took a larger share than either Canada and the U.S., of the increase in the combined market; in the Canadian market; and in both halves of the period reviewed. For the period as a whole, other countries accounted for more than 22 per cent of the increase in the combined market even though they did not represent more than about 10 per cent of total supply. In Canada in the second half of the period, all countries other than Canada or the United States accounted for 17.4 per cent of the market's increase,
thereby improving their market share, but not quite as fast as in the U.S..
- The U.S. share in the Canadian market in the first half of the period increased, while in the second half it showed virtually no change.

## 4. Industry Analysis

The industry analysis shows which industries contributed most to Canada's gains, both at home and in the U.S. market, in the course of the period reviewed. For example, the industries producing transportation equipment, food, chemicals, electrical and electronic and paper accounted for well over half of Canada's gains in the combined market for the period as a whole. The same industries were responsible for three-quarters of the gains in the U.S. market in the course of the same period (even though food contributed proportionately less). Transportation equipment, electrical and electronic, and chemical industries accounted for most of the gains (over 70 per cent) recorded by Canada in the United States in the second half of the period.

## Section 2

## United States Market

From 1981-83 to 1989-1991, the U.S. market increased by almost $\$ 900$ billion and there was no significant difference between the increase in the first and the second half. Nor was there a significant difference in Canada's contribution to the overall change: just over $\$ 20$ biltion in the first half and just under in the second. In terms of share gained, there was somewhat more of a difference: the second half gain, though substantial, was less than for the 1981-83 to 1985-87 period.

Other countries also gained market share in the United States, in the two halves of the period reviewed, more so than Canada. Actually, their performance in the U.S. market was similar to their performance in the Canadian market: successive and impressive gains in market share but with lesser share gains in the second half of the 1981-83 to 1989-91 period.

It was the U.S.'s domestic industry that showed substantial losses in market share, particularly in the first half of the period. From an average of 88 per cent for the entire period, the U.S. saw its position reduced to 86 per cent in the second half. Moreover, it only accounted for 78 per cent of the growth of its domestic market, implying a further reduction in its share.

Chart 10
Change in U.S. Imports from Canada (1981-83 to 1989-91)

In terms of Canadian industries performance, there was a fair amount of diversity between the first and the second halves of the period under review. In the first half, twenty Canadian industries showed gains, some of which - primary metals in particular - were very strong. The only industry showing a loss in market share beverages - was among the least sizeable in terms of the level of exports to the United States. One other industry - tobacco - showed no change in market share.

In the second half of the period, the number of Canadian industries recording share gains fell appreciably - from twenty to fifteen. The number of industries reporting loss in share rose to five - leather, wood, primary metals, printing, and refined petroleum (see Table 3). The remaining two industries - non-metallic minerals, and clothing - showed no change in share. However, among the industries that showed second half gains were machinery, transportation equipment, and electrical and electronic equipment, the last two being relatively sizeable in terms of Canadian exports.

Industries in all other countries supplying the U.S. market had a similar experience. In the first half of the period, twenty-one reported gains; only tobacco reported a loss in share. But in the second half, the number of gainers was down to thirteen with beverages, tobacco,
textile products, wood, primary metals, refined petroleum, primary textiles, and paper showing losses in U.S. market share. Plastic reported no change.

The United States reported a reverse pattern: The second half brought about a drop in the number of industries recording losses in shares. In the first half, only one industry featured as a gainer: tobacco's share actually grew. There were no industries recording "no change". But in the second half of the period, the number of share losers was down to eighteen with four beverages, refined petroleum, primary metals and wood - actually gaining.

Table 3 shows the number of industries reporting gains and losses of market share. Table 4 shows the contribution to total change in the market by share gainers and losers. The data were compiled from the detailed tables in Section 7. Not reflected in the table, however, is a drop in the rate of share gain for some Canadian industries. For example, both furniture and transportation equipment gained share in the second half of the period but at a reduced rate compared to their gains in the first half. On the other hand, there was a much faster rate of share gain for Canadian electrical and electronic industries in the second half than in the first.

| 1985-87 to 1989-91 | 18.1 | 0.6 | - | 52.7 | 288.9 | - | 78.5 | $-1.6$ | 0.7 |

Over the entire period, the value of manufactures supplied to the U.S. market by all other countries, increased by almost $\$ 200$ billion. This is between a filth and a fourth of the market's total increase. A handful of countries - Japan, the EEC, and the Southeast Asian newly industrialized countries (hereafter NICs) ${ }^{6}$ accounted for two thirds of the increase.

The experience of the selected suppliers to the U.S. market in the course of the period reviewed was uneven. For example, 61 per cent of total growth took place in the first half of the period. During that time, Japan, the EEC, and NICs contributed over four fifths ( 81 per cent) of the market's increase. In the second half of the period, however, the same countries accounted for somewhat less than half.

Japan alone contributed one third of the increase in the U.S. market during the first half of the period. In the second half, its share of the increase dropped to one sixth.

EEC countries accounted for over one fourth of the first half growth. Their share of the change also dropped to one sixth.

[^2]The NICs appeared to have held on to their part of the market somewhat better even though their share of the change also dropped from 21 to 16 per cent.

The gainers in the second half of the period are not shown in Table 5. They are first and foremost China, P. Rep. and Mexico.

In terms of industries, the experiences also varied from one country to another and among industries. There were few patterns carried over between the first and the second halves of the period reviewed.

For example, in the case of Japan, the top industry contributors to the first half change were the transportation equipment, electrical and electronic, and machinery industries (jointly these three industries accounted for 87.5 per cent of total growth). But, in the second half of the period, machinery dropped out of the list of the top three contributors to the increase in the U.S. market. Electrical and electronic industries took first place among the contributors to growth. Transportation equipment came a distant second.

In terms of the propensity to import Japanese goods produced by any of the top rated industries into the United States, the statistics suggest a drop between the first and the second halves of the period reviewed.

Table 5
Net Contribution to Change in U.S. market
Selected Countries
(billions of U.S.\$)

|  | All Other <br> Countries | Japan <br> Industrialized |  |
| :--- | :---: | :---: | :---: |
| $1981-83$ to $1985-87$ | 120 | 40 | 25 |
| $1985-87$ to $1989-91$ | 77 | 13 | 32 |
| $1981-83$ to $1989-91$ | 197 | 53 | 12 |

* Excluding Canada and the United States

The top industry contributors to the change accounted for by the EEC in the U.S. market between 1981-83 and 1985-87 were transportation equipment, machinery, and toys and precision instruments (other manufacturing). In the second half of the period, however, transportation equipment ranked a poor third to toys and precision instruments and to electrical and electronic equipment. Machinery dropped out of the list. All industries mentioned lost in terms of the U.S. propensity to import from them.

Finally, the experience of the NICs was somewhat more consistent. The major contributor to change in the two halves of the period was the electrical and electronic industry. Clothing and toys and precision instruments remained in second and third place respectively but with vastly diminished contributions. Exceptionally, the propensity to import goods produced by the NIC's electrical and electronic industries went up between the two halves of the period mentioned.

## Section 3

## Canadian Market

The salient facts of trade in the Canadian market over the entire period covered, 1981-83 to 1989-91, are that the value of manufactured goods available for domestic use increased by 64 per cent and that about two thirds of the increase took place in the second half of the period. Overall, Canada's manufacturing industries lost share in their domestic market but most of those losses took place in the first half. Indeed, while Canadian industries only
accounted for $\$ 11$ billion out of a first half increase of $\$ 34$ billion (marginally less than one third) it accounted for \$38 billion out of $\$ 69$ in the second half (well over half).

The story for the other suppliers - the United States and all other countries - also showed variation between the two halves of the period. In the case of the United States, while its overall share of the Canadian market was only marginally more than 25 per cent, its supplies of manufactured goods to Canada accounted for over 40 per cent of the market's increase in the first half of the period. This rate of increase in share was not sustained in the latter half of the period; the share in the change was of the same order of magnitude as the U.S.'s share of the market. Other countries saw their share increase rapidly in the 1981-83 to 1985-87 period, and somewhat less rapidly in the 1985-87 to 1989-91 period. In this respect, their performance was similar to that recorded for the United States's market.

There were considerable differences in the experience of individual industries both among themselves and in terms of the first and second halves of the period reviewed. The home share losses experienced by Canadian manufacturing industries were widespread. In the first half of the period, eighteen industries lost share and four gained. In the second half of the period, nineteen industries lost share, and three gained. The gain in tobacco, machinery, and transportation equipment offset a substantial part of the market share losses experienced by other industries.

There were a number of reversals. The industries that went from share loss to share gain were machinery and transportation equipment. Plastics, printing and primary metals also reversed their performance, but in the opposite direction. Only the tobacco industry gained share in both periods.

| 1981-83 to $1989-91$ | 15.0 | 34.3 | - | 19.6 | 13.5 | - | 21.2 | - | - |
| 1985-87 to 1989-91 | 8.2 | 29.7 | - | 18.2 | 0.8 | - | 9.4 | 1.9 | 0.7 |

The performance of U.S. industries in the Canadian market appeared to improve markedly between the first and second half of 1981-83 to 1989-91. This happened in spite of the fact that, overall, the U.S. just managed to maintain its share of the Canadian market in the second half whereas it improved its standing in the earlier period. The explanation is that some of the share losses in the second half of the period cut deeper; in particular, there was a noticeable drop in the share of U.S. transportation equipment industries in the Canadian market.

In the first half of the period, only nine U.S. industries could claim improvements in their share of the Canadian market. Twelve recorded losses and one did not move perceptibly. In the second half, the total number of gainers rose to nineteen; and only three (beverages and tobacco in addition to transportation equipment) experienced a loss of share. Some of the gains were pronounced: those by clothing, furniture, and primary metals. However, in absolute terms, the corresponding markets did not expand much over the second half of the period.

The experience of Other countries' industries was the reverse of that recorded for the United States. In the first half of the period, nineteen industries experienced gains. Tobacco, wood, primary metals and refined petroleum showed losses. In the second half of the period, the number of industries showing gains dropped to fourteen with four industries showing no change (paper, printing, chemicals. and toys and precision instruments).

Some gains were very pronounced: leather (in both periods); primary textiles (in the first period); and plastics and machinery (both in the first period). Large gains in share were made by the machinery industry, but only in the first half of the period covered, and the transportation equipment and the electrical and electronic industries in both halves of the period.

Table 8 shows a selection of countries or country groupings which accounted for most of the share gains in the Canadian market.

The joint experience of Japan, the EEC, and the NICs in the Canadian market is not altogether different from their experience in the United States. Between the first and the second halves of the period reviewed, these countries accounted for proportionately less than the growth in supply to the Canadian market. Unlike their
experience in the U.S., the extent to which their second half performance fell short of the first half, was also less from some 81 to 64 per cent.

Also unlike the United States, there was less contrast in the country structure of contributions to change between the first and the second halves of the period reviewed. And still unlike their experience in the United States, the EEC remained unchallenged as the principal contributor to the increase posted by the Canadian market.

Within each of the supplying countries or country groupings, there were changes in the industrial composition between the first and the second halves of the period under review.

In the case of Japan, in the first half of the period, the principal contributing industries in descending order of contribution were transportation equipment, electrical and electronic, machinery, and toys and precision instruments. Together, these industries accounted for 93 per cent of Japan's total contribution to the increase in the value of manufactures supplied to Canada's home market. The same industries retained their rank in the second half. Their share of the overall change was even higher - 95 per cent. But of the four, only transportation equipment saw its share in change increase at a faster rate.

In the case of the EEC, one striking feature was the fact that many more industries shared in the community's contribution to change in the Canadian market. This was the case in both halves of the period reviewed. Machinery, transportation equipment, chemical, and electrical and electronic industries accounted for 51 per cent in the first half and for two thirds of the overall change for the EEC in the second half.

In the case of the NICs, three industries (electrical and electronic, toys and precision instruments, and clothing) out of four (transportation equipment being the fourth) that contributed most of the change in the first half of the period continued to be the major contributors in the second half. A striking feature was the enormous increase in the importance of the electrical and electronic industry as a contributor to change. From a share of about 25 per cent of the total change recorded in the first half of the period, it rose to half in the second.

## Section 4

## Miscellaneous Topics

A number of tests were applied to the data to analyze their properties, in particular in connection with traderelated variables. What follows is a summary of some of these tests, the results of which shed further light on the trading patterns between Canada and the United States over the last decade.

## 1. Changes in Tariffs

For Southbound trade, (trade in the United States market) U.S. tariff rates were compiled and weighted by the respective trade flows for the years 1989 and 1991. The weighted rates were aggregated into the twenty-two industry categories. These categories were subsequently related to the change in the U.S. propensity to import from Canada for each of the industries and years mentioned. The presumption was that, as tariffs were
reduced, the propensity to import would increase. This association is borne out by Chart 13. The degree of negative correlation between the two variables is -0.80 which implies that almost two thirds of the variability (coefficient of determination of 0.64) in the changes in import propensity can be attributed to corresponding changes in tariff rates.

The same test was conducted on Northbound trade, this time using the Canadian tariff in association with changes in Canadian propensities to import from the United States. The weighting and aggregations and the period covered were strictly the same as for Southbound trade. The results, while not as marked as for Southbound trade, are nevertheless revealing

The coefficient of correlation is estimated at -0.69 which implies that just under half the variability in the Canadian propensities to import from the United States can be accounted for by the reduction in Canadian tariffs (Chart 14).

Note that for primary textiles, textiles, and clothing, ail of which were relatively protected by tariffs, the strength of the negative association is particularly marked.

## Chart 14

## Change in Tariff Rate by Per cent Change in Canadian Import Propensity from U.S., (1989-91)

Change in Tariff Rate
Change in Tariff Rate

## 2. Relative Performance and Absolute Size

To assess whether relative gains in share might be easier for industries with well established export performance than for those with less of an export foothold, tests were conducted using data for the second half of the period to identify any relationship between the relative gains by Canada and the United States in each other's markets, and the size of industries making such gains. For purposes of the tests, Canadian industries were classified by the difference between their share in the U.S. market and that of Canadian manufacturing industry as a whole. Those differences are marked on the $y$-axis of the scatter diagram shown in Chart 15. The gains (and losses) in share are also related to the performance of manufacturing as a whole and marked on the $x$-axis. The difference between the two scales is that differences on the $y$-axis are absolute whereas those on the $x$-axis are relative. The resulting pattern suggests that, in fact, it was the industries with smaller shares that showed the largest relative gains. Indeed, twelve such industries appear in the fourth quadrant (tobacco and primary textiles not shown in chart due to scale limitations). One outstanding exception was transportation equipment which, in spite of having a much larger share than average, also reported moderate relative gains in its share of the U.S. market.

The same test conducted on Northbound trade showed similar results (Chart 16). Sixteen U.S. industries appear in the fourth quadrant (clothing and furniture not shown in chart due to scale limitations). The outstanding
exceptions are transportation equipment - which in the case of the United States actually lost share - and machinery, which showed a very modest gain in share.

## 3. Canadian/U.S. Share Gains and Losses

This test was designed to verify that relative share gains by Canadian industry in the U.S. market were associated with relative share losses by U.S. industry. The experiment was carried out for the period as a whole and for the second half. The scatter diagrams (Charts 17 and 18) show changes in performance of U.S. Industries in the U.S. market on the $y$-axis and changes in performance of Canadian industries in the U.S. market on the $x$-axis. The results are not entirely obvious: for the period as a whole there is no strong association although most Canadian industry gainers correspond to U.S. industry losers. But this is no more than a statement that there is a large majority of the former and an equally large majority of the latter. More interesting is the fact that for the second half of the period the association is much more marked.

The same exercise performed on Northbound data produced results which were less obvious (Chart 19 and 20). Once again there is a concentration of points in the second quadrant but it means no more than the fact that there are large numbers of U.S. share gainers and equally large numbers of Canadian share losers. There is very little suggestion that the degree of loss is in any way associated with the corresponding degree of gain.

1985-87 to 1989-91

## 4. Exchange Rates

The value of the Canadian dollar in U.S. funds has a high degree of association with the Canadian propensity to export to the United States. However, it is also highly related to the U.S. propensity to export to Canada. Given the fact that the two relationships are positive, their joint significance is open to question. More work is required before these relationships become interpretable. The issue is how the exchange rates affect contracts for U.S. purchases of Canadian merchandise and conversely Canadian purchases of U.S. goods. Because so many of these contracts are denominated in U.S. rather than in Canadian dollars, the impact of appreciations and depreciations of the two currencies vis-à-vis each other is neither immediate nor necessarily in the obvious direction. Chart 1 of Section 1 shows the U.S./Canadian dollar exchange rates for the entire period plotted against the Canadian propensity to export to the United States market.

## Section 5

## Mexico in the U.S. Import Market

Canada-Mexico trade is relatively small. Northbound it represents less than two billion dollars annually or 1.3 per cent of all Canadian imports. Southbound it represents even less - half of one per cent (\$640 million) of all Canadian exports. Seen from Mexico's point of view, the proportions are somewhat more significant ( 2.4 per cent of Mexican exports and 1.3 per cent of imports). Even so, Canada is not among Mexico's top ranking trade partners. However, Mexico has become a ranking trade partner of the United States. For example, it is among the top ten exporters to the United States in eighteen out of twenty-two manufacturing industries. Moreover, on the surface, the range of its exports overlaps substantially with that of Canada.

The comparison of Canadian and Mexican imports into the United States has as its objective to estimate that part of Canadian trade that appears to be in direct competition with Mexico's. The method used to estimate the extent to which imports from the two countries overlap is indirect. It consists of several stages. In the first stage, all imports of manufactured goods were selected for which both Mexico and Canada share the same detailed product classification code. In terms of the classification used by the United States to break down its imports, maximum detail is described by a ten digit code (the six standard digits of the Harmonized System plus four
additional digits which incorporate both tariff and a supplementary statistical annotation). The Canadian value of the import classes in which there is overlap was tabulated after being assigned to one of the twenty-two manufacturing industries.

In a second stage, unit values (the ratios of the value of the imports for a given ten-digit category to its corrosponding quantity) for imports from Mexico and from Canada were compared. In the overwhelming majority of cases, the distribution of the ratios of Mexican to Canadian unit values was bell-shaped with the highest frequencies centred around a unit ratio. Accordingly, the two tails of the distribution were cut off at the third percentile. Only those categories were retained for which the ratio of Mexican to Canadian unit values was within 0.03 and 11.9. This supplementary constraint was used to eliminate those categories for which, in spite of sharing the same label, imports from the two countries were almost certainly different goods.

In a third stage, only those categories were retained for which Mexican or Canadian imports as a proportion of the sum of Mexican plus Canadian imports fell within a given range. This had the purpose of excluding cases where, a priori, imports from Mexico or Canada were incidental. Two thresholds were chosen: one and three per cent of imports from the two origins.

The results of these thresholds are described in Table 9 below, both for imports of all manufactured products and for each of the twenty-two manufacturing industries. The results show a very rapid drop in overlap as the stringency of the similarity tests increase: from a calculated overlap of 42 per cent of Canadian trade, down to 20 per cent at the 1 per cent threshold, and a further drop to 15 per cent at the 3 per cent level.

The periods chosen for these comparisons - the years 1989 and 1991 - were averaged.

In the first stage, the range of the overlap by manufacturing industry, representing imports from the two countries of goods of similar specification, is wide: at one extreme a mere 4.5 per cent for furniture and fixtures, and at the other, just over 83 per cent for clothing. More typical overlaps are 64 per cent for primary metals, 57 per cent for fabricated metals, and 66 per cent for paper. Less marked, but by no means insignificant, are the overlaps for transportation equipment ( 33 per cent), electrical and electronic (42 per cent) and chemicals ( 38 per cent).

While the application of the thresholds resulted in a dramatic drop in overlap, all industries were not affected equally. At the 3 per cent level, the tobacco industry showed no overlap, paper (4 per cent), primary metals (14 per cent), and the electrical and electronic's overlap dropped by half to 20 per cent.

Table 9
Areas of Competition in United States Imports: Canada = Mexico
Average for 1989/1991

| SIC | U.S. Imports from Canada and Mexico | Of which: Imports from Canada | Of which: Overlap with Mexico |  |  | Overlap's Share in Manufactured Imports from Canada |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | at $1 \%$ level | at 3\% level |  | at $1 \%$ level | at 3\% level |
|  | Millions of U.S.\$ |  |  |  |  | \% |  |  |
| Total Manufacturing | 97,347 | 75,956 | 31,925 | 15,625 | 11,466 | 42.0 | 20.6 | 15.1 |
| Food | 2,425 | 1,840 | 599 | 417 | 275 | 32.5 | 22.7 | 14.9 |
| Beverages | 801 | 561 | 224 | 219 | 201 | 40.0 | 39.1 | 35.9 |
| Tobacco products | 91 | 86 | 69 |  |  | 80.5 | 0.0 | 0.0 |
| Rubber products | 951 | 848 | 651 | 379 | 332 | 76.7 | 44.7 | 39.1 |

## Section 6

## Methodology and Technical Notes

## 1. Definitions and General Principles

This section defines the relationships used.

## (a) Definitions

## Export propensity:

$$
\frac{\text { Exports to Country } \mathrm{A} \text { from Country B }}{\text { Exports to all Countries from Country B }}
$$

Total Market Share:
Imports from Country A into Country $\mathrm{B}^{6}$
Domestic Supply for Country B
where

## Domestic Supply:

Manufacturing shipments + Imports - Exports
Import Market Share:
$\frac{\text { Imports from Country A into Country B }}{\text { Imports from all Countries into Country B }}$

## Relative Change in Share:

If $m_{i j}$ is the value of imports at periods $\underline{0}$ and $\underline{1}$ of goods manufactured by industry $j$ in country $i$, the identity is:

6 or imports originating in Country A.
and the terms denoted by $a, b$, and $c$ correspond to the three components listed above. Component $c$ is the "relative performance" of industry j of country $i$ in market $\Sigma_{\mathrm{ji}} \mathrm{m}_{\mathrm{ij}}$.

## (b) Data Sources

Three main classification types are used in the study: industry, commodity and geographic.

The lack of common classification systems presented a number of problems which were overcome by converting much of the data given below into the Canadian Standard Industrial Classification. The data used were:

|  | Period | Indusiry | Commodity | Geographic |
| :---: | :---: | :---: | :---: | :---: |
| United States |  |  |  |  |
| Shipments | $\begin{aligned} & 81-86 \\ & 87.91 \end{aligned}$ | $\begin{aligned} & \text { US-SIC-72 } \\ & \text { US-SIC-87 } \end{aligned}$ | Prod. List Prod. List | United States United States |
| Imports | $\begin{aligned} & 81-88 \\ & 89-91 \end{aligned}$ | N/A <br> N/A | TSUSA US-HS-10M | Schedule C <br> Schedule C |
| Exports | $\begin{aligned} & 81-88 \\ & 89-91 \end{aligned}$ | N/A <br> N/A | Schedule B US-HS-10X | Schedule C <br> Schedule C |
| Canada <br> Shipments | $\begin{aligned} & 81-87 \\ & 88-91 \end{aligned}$ | $\begin{aligned} & \text { CA-SIC-80 } \\ & \text { CA-SIC-80 } \end{aligned}$ | $\begin{aligned} & \text { ICC } \\ & \text { SCG } \end{aligned}$ | Canada Canada |
| Imports | $\begin{aligned} & 81-87 \\ & 88-91 \end{aligned}$ | N/A <br> N/A | CITC CA-HS-10 | CA-CNTRY ISO |
| Exports | $\begin{aligned} & 81-87 \\ & 88-91 \end{aligned}$ | N/A N/A | $\begin{aligned} & \text { XCC } \\ & \text { CA-HS-8 } \end{aligned}$ | CA-CNTRY ISO |

[^4]The data were obtained from:
United States shipments: U.S. Department of Commerce, Bureau of the Census, Industry Division

United States imports and exports: U.S. Department of Commerce, Bureau of the Census, Foreign Trade Division

## Canadian Shipments:

Statistics Canada, Industry Division
Canadian imports and exports:
Statistics Canada, International Trade Division

## (c) Concepts

Trade figures are collected and compiled by commodity rather than by industry. In order to derive trade figures by industry, the commodity detail compiled by Canada and the U.S. was assigned to categories of the 1980 Canadian Standard Industrial Classification (CA-SIC80) and the United States 1987 Standard Industrial Classification. Moreover, for the United States, trade and shipments by industry were concorded to the CA-SIC-80, such that the data by industry in this publication are all expressed in terms of the CA-SIC-80. A more complete discussion of the process is given in the concordance section below.

## (d) Commodity Classification

Since 1988, Canada has used the Harmonized Commodity Description and Coding System (HS) at the 6digit level, containing approximately 6,000 commodities for the classification of shipments, imports and exports. Additional digits are used for extra detail: 2 for Exports (the Canadian Export Classification or CEC), 3 for shipments (the Standard Classification of Goods or SCG), and 4 for Imports (the Customs Tariff or CT).

Since 1989, the United States has also used the HS for its import and export statistics. Accordingly, the 6-digit system is identical in both countries. The United States has created its own import and export versions by adding 4 more digits. For domestic shipments, a completely separate commodity classification system (Product List) has been used.

Before the introduction of the Harmonized System, different classification schemes were used for shipments, imports and exports. In Canada, the Export Commodity Classification (XCC), the Import Commodity Classification (MCC), and the Canadian International Trade Classification (CITC) were used for trade. For shipments, the Industrial Commodity Classification (ICC) was used. Trade data were also available in both countries according to the United Nations' Standard International Trade Classification, rev. 2 (SITC).

For more information on the commodity classification schemes used, contact the:

United States Bureau of the Census: (telephone (301) 763-5333)

Statistics Canada: Standards Division: F. Pope: (telephone (613) 951-3461)

## 2. Data Description

## (a) Trade Data

Merchandise exports and imports represent respectively the additions to and subtractions from the stocks of merchandise in a country that either originate in or are destined abroad. Data on exports and imports are derived from Customs records in both Canada and the United States. The following are some possible sources of error in the data:
(1) Misclassification of commodities
(2) Undercoverage of exports

Export declarations are generally less well controlled than import declarations, prompting the United States and Canada to replace their export statistics with the other country's import statistics. The resulting data exchange between Canada and the United States first took effect with January 1990 data. Accordingly, data for the period prior to the data exchange may reflect undercoverage. There is also a possibility of discontinuities in time series, arising as a result of the exchange.
(3) Misclassification of destination/origin

In some cases the final destination is not known (or reported) at the time goods are exported. In particular, goods shipped to the United States or Canada could be "transshipped" to other countries.

## (4) Valuation

The valuation placed on the exports (and imports) may differ from the "transaction price" called for by International conventions, particularly for transactions between parent and subsidiary companies. This may result in trade being under or over-valued, with implications for comparisons between countries.

Exports from the United States and Canada are valued "Free alongside ship" (FAS) and "Free on Board" (FOB), respectively. These are nearly identical concepts. However, imports are valued differently. in the United States, imports include the cost of insurance and freight (CIF) from the point of direct shipment (point of exit). In Canada, imports are valued as FOB point of exit, and so do not include the cost of insurance and freight (which is approximately 4-5 \% between Canada and the United States). In neither case are import values strictly comparable with domestic shipments, but relationships among foreign countries should not be affected.

In order to put the Canadian import vlauation on the same basis as the U.S., a factor of $4.5 \%$ is used to adjust for the CIF valuation.

## (b) Manufacturing Shipments

Shipments for the year 1991 are estimated by applying the movement from 1990 to 1991 recorded by the Monthly Survey of Manufacturers (Monthly Shipments, Inventories and Orders (SIO)) to the 1990 shipments recorded in the annual survey.

The United States manufacturing shipments data were obtained from the U.S. Department of Commerce, Bureau of the Census. Shipments for 1991 were estimated using all available monthly survey information. The US-SIC-72 was used for shipments up until 1986, when the US-SIC-87 became the standard industrial classification.

## 3. Converting to Standard Classifications: Concordances

## (a) Concordance from Commodity to Industrial Classification

Export commodities are allocated to the industry mostly responsible for their production. However, when an export class consists of a grouping of commodities from different primary producers, it is allocated among these primary producers in proportion to the commodity distribution within the class for a fixed period (HS-1989, XCC-1987).

For imports, the same basic principle applies: import commodities are allocated to the Canadian industry that would be primarily producing them if they were produced in Canada. They do not reflect the actual imports by an industry. Wherever a commodity is imported but not produced in Canada, it is assigned to the nearest equivalent Canadian industry. This principle is consistent with a United Nations recommendation (see Classification of Commodities by Industrial Origin, United Nations (Statisical Papers, Series M, No. 43).

Over the period reviewed, there are two commodity classification systems and two distinct concordances; pre and post-HS. The pre and post-HS concordances reflect the production structure of the two different periods (pre1988 and 1988 to date in Canada and pre-1989 and 1989 to date in the United States). The post-HS concordances are based on more commodity detail than for the pre-HS There are some "inconsistencies" between the concordances. In order to estimate consistent industry trade data for the 1981-1991 period, it was necessary to make a number of adjustments to the two digit CA-SIC80.

For this study, it was decided to revise the concordances to minimize any shifts between SICs for the same commodities. Special attention was paid to the swing years 1987 and 1988, when the switchover to the

HS occurred. Growth rates were calculated for 2 digit industry groups on both bases and, where discrepancies were large, the linkages were adjusted. In addition to the direct commodity-to-SIC linkages, linkages from the detailed level commodities to the Input/Output (//O) commodities and SICs were reviewed, resulting in 8 changes to the SIC code linkage for the HS at the 8-digit level, 40 for the HS at the 10 -digit level, 26 for the XCC. and 131 for the CITC.

These concordances were applied to data before aggregation for reasons of confidentiality. Trade data by industry cannot be reproduced, although Statistics Canada's Official Concordances and detailed nonconfidential trade data are available to the public.

The following characteristics of the commodity-toindustry concordances should be noted:

1) The concordances are fixed through time. This caveat is not important for short term comparisons nor for industries with high specialization and coverage ratios.
2) The industry trade data are not a direct measure of trade flows by industry. They have been derived from concordances based on the assumption that a traded commodity is allocated only to its primary producer. This assumption might create two potentially offsetting biases:
i) an upward bias because an industry is assumed to be responsible for all exports of its primary commodities even if part or all of these trade flows might in fact be due to secondary producers. This bias is more likely for industries that have a low coverage ratio, i.e. produce a low fraction of their primary commodities; and
ii) a downward bias because an industry is assumed not to export any of its secondary products. This is more likely when a small proportion of an industry's total production consists of its primary commodities.

The table below shows these two ratios for Canadian industries in 1990. Most industries at these somewhat highly aggregated levels exhibit high specialization and coverage ratios.

Specialization ratio: the ratio of the value of the principal commodities produced by the industry to the value of all commodities produced by the industry.

Coverage ratio: the ratio of the value of the principal commodities produced by the industry to the total value of production of that commodity, irrespective of producer.

Table M-1
Canadian Manufacturing Industries, Specialization¹ and Coverage² Ratios (1990)

| SIC | Industry Name | Specialization Ratio | Coverage Ratio |
| :---: | :---: | :---: | :---: |
|  |  | (\%) | (\%) |
| 10 | Food products | 99.4 | 99.6 |
| 11 | Beverages products | 99.4 | 100.0 |
| 12 | Tobacco products | 98.0 | 100.0 |
| 15 | Rubber products | 91.2 | 95.4 |
| 16 | Plastic products | 94.4 | 93.1 |
| 17 | Leather and allied products | 97.0 | 97.5 |
| 18 | Primary textiles | 97.3 | 96.2 |
| 19 | Textile products | 91.0 | 93.2 |
| 24 | Clothing | 99.2 | 99.4 |
| 25 | Wood | 98.4 | 99.0 |
| 26 | Furniture and fixtures | 97.3 | 83.1 |
| 27 | Paper and allied products | 98.4 | 98.0 |
| 28 | Printing, publishing and allied | 97.7 | 98.8 |
| 29 | Primary metals | 91.6 | 96.5 |
| 30 | Fabricated metal products | 90.0 | 94.0 |
| 31 | Machinery | 94.4 | 91.4 |
| 32 | Transportation equipment | 97.8 | 99.3 |
| 33 | Electrical and electronic products | 97.5 | 97.5 |
| 35 | Non-metalic mineral products | 96.4 | 98.1 |
| 36 | Refined petroleum and coal | 97.5 | 97.6 |
| 37 | Chemical and chemical products | 96.5 | 97.1 |
| 39 | Other manufacturing | 89.1 | 93.5 |
|  | Total manufacturing | 99.2 | 100.0 |

1 Services outputs such as custom and repair work are excluded from this calculation as they are not included in customs based trade statistics.
2 The denominator of the coverage ratios (total production in the economy of industry primary commodities) does not include non-manufacturing industries production of goods primarily produced by manufacturing industries. This explains why the coverage ratio is $100.0 \%$ for Total Manufacturing. If we take account of wholesale productivity, the coverage ratio is $99.2 \%$.

## (b) Concordance from United States to Canadian Industrial Classification

The concordance between U.S. and Canadian industrial classifications is also based on the primary producer concept. The data for each U.S. industry are allocated to its nearest counterpart for the production of the principal commodities produced by the U.S. industry.
U.S. trade and shipments data were converted to the CA-SIC-80 using Statistics Canada's concordance from US-SIC-87 to Canadian SIC(80). U.S. shipments data for years prior to 1987, available only on the US-SIC-72 basis, were converted to US-SIC-87 using overlapping data from both basis for the year 1987.

## 4. Mexico - Canada: Overlap in United States Import Market

In order to detect commodity groupings in which Canada and Mexico potentially compete in the United States import market, the following steps were taken:

## Source data: U.S. Bureau of the Census

(1) grouping of Canadian and Mexican exports to the U.S. by the Canadian industry presumed to produce them;
(2) tabulate quantities, values, and unit values of Canadian and Mexican exports by HS-10 commodity code;
(3) eliminate commodities where unit values were nonexistent in one or both countries or where they differed widely;
(4) for each MS-10 category, the unit values of U.S. imports from Mexico and Canada were expressed as a relationship (eg. Mexico > Canada or Canada > Mexico) as a ratio;
(5) commodities which, while sharing the same HS-10 code, were considered un-equal, were removed from the data where:
(i) unit values fell outside a range set by the Canadian edit boundaries;
(ii) the ratio of the Mexican unit values to the Canadian unit values were in the three or ninetyseven percentile ranges.
(6) overlapping trade by both countries into the U.S. were shown as degrees of overlap with data grouped into categories representing the porportion of Mexican or Canadian imports to the total for both countries. This identifies cases where one country is dominant. The thresholds for dominance were arbitrarily set at 1 and $3 \%$. For example, if there were $\$ 5,000$ of a commodity imported from one country, and $\$ 500,000,000$ from the other, the countries are deemed to overlap. However, since the overlap is less than one per cent, the degree of competition is inconsequential.

## Quality of the data

This process is dependent on the accuracy of the reported values and quantities, and the commodity coding. The coding and values of the reported data are considered reliable. However, the quantities are not as reliable. Therefore these statistics should only be used as general indicators.

This process is dependent on other factors:
(1) the selection of thresholds for determining the "sameness" of commodities;
(2) the selection of thresholds for determining degrees of overlap;
(3) the use of summary tabulations as opposed to individual transactions (which are unavailable). The average price (unit value) from each country used in the comparison could represent a narrow or wide range of individual transaction prices.

For example, the summary (average) price could be $\$ 42$ for Canada and $\$ 9$ for Mexico. The transaction level information may be:

|  | Canada |  | Mexico |  |
| :---: | :---: | :---: | :---: | :---: |
| Transaction | 1 | 2 | 3 | 4 |
| Value | \$4mil | \$4mil | \$2mil | \$2mil |
| Quantity (in numbers) | 57,000 | 134,000 | 44,000 | 400,000 |
| Price per unit | \$70 | \$30 | \$45 | \$5 |
| Summary/Average |  | (A) |  | (B) |
| Value |  | \$8mil |  | \$4mil |
| Quantity (in numbers) |  | 191,000 |  | 444,000 |
| Price per unit |  | \$42 |  | \$9 |

It is not clear that there are $1,2,3$ or 4 different goods, although the lowestprice Mexican good may not be the same as the other three. The application of the thresholds or the sub-dividing of the commodities at this level could change results.

## Section 7

## JOIN THE Celebration <br> WITH THE MOST USEFUL AND ATTRACTIVE CANADA YEAR BOOK EVER PUBLISHED.

On the occasion of the nation's 125 th anniversary of Confederation, the 1992 Canada Year Book takes a unique look at the fascinating highlights in the development of Canada since 1867.

Exceptionally popular among business people, journalists, librarians,
parliamentarians, educators and diplomats for 125 years, the 1992 Canada Year Book is designed as a comprehensive reference source for the latest on economic, political, and social information on Canada and Canadians. And for the first time, this "special collector"s" edition presents picturesque vignettes on Canada's past with informative, easy-to-read text.

Special features include:

- anew 22 cm X 30 cm ( $9^{\prime \prime}$ X 12 ") format
- larger typeface
- over 300 rare archival pholos
- historical perspertives on Canada's past
- 22 chapters, 577 pages bound in deluxe hard cover.
'Time and time again, you'll reach for this compact encyclopedia to answer questions on all aspects of Canada.
- THE LAND
- THE PEOPIE
- the vation - the economy
- ARTS AND LEISURE

## Arailable in separate English and French editions, the Canada Year Book (Cal. No. 11-402E) sells for \$49.95

 (phus $\$ 5.0$ j shipping and handling) in Canada, LS $\$ 60$ in the I nited Stales, and LS $\$ 70$ in other countries (includes shipping and handling).To order, write Publication Sales, Statistics Canada, Ottawa, Ontario, K14 OT6, or contact the nearest Satistics Canada Regional Reference Centre listed in this publication.

## Now

More'Than Ever, Strategic Planning Requires Reliable TradeInformation...

## . . . And We're Got It.

At the International Trade Division, Statistics Canada, we edit, compile and analyse data from hundreds of thousands of Customs documents each month. Available on tape, printouts, microfiche diskettes or publications, these statistics can serve to:
$\checkmark$ determine market shares
identify domestic and foreign market trends
$\checkmark$ forecast inventory and plan production
$\checkmark$ describe merchandise trade

## Do You Need A Special Report <br> Designed To Meet Your Specific Needs? <br> We've Got It!

If you are interested in one commodity or a certain countty, you may wish a monthly, quarterly or annual report on exports/imports. We can tailor a report just for you Data variables include:
$\checkmark$ U.S. state of destination
$\checkmark$ quantity shipped
$\checkmark$ mode of transport
HSclass
$\checkmark$ country origin/destination
$\checkmark$ value of commodity shipped

## Do You Need Comprehensive World Trade Data? <br> We've GotIt!

Our W'orld Trade Database presents a complete matrix of country to country trade flows for 160 countries, 600 commodities and 300 industries. That's the most comprehensive database of comparable trade data available today.

## Do You Need a Complete Database of Timely Trade Statistics? <br> We've Got It!

TIERS, our new software package provides data on over 15,000 commodities for 200 countries at the most detailed level for imports and exports. It is updated monthly, just 48 hours after the data are released and allows you immediate access to quantity, value, province, year and U.S. state code variables.
