DATA PROCESSING

The main output of this survey are a number of "clean" microdata files. This section presents a brief summary of the processing steps involved in producing these files.

7.1

Data Capture

Capture of LMAS data was accomplished using minicomputers located in each of Statistics Canada's Regional Offices. During this process any document containing at least one interviewer-completed item was captured and an unedited version of the computer record electronically transmitted to Ottawa for further processing. In total 67,516 documents containing 9,645,398 bytes of information were captured and transmitted.

7.2

Editing and Correction

The first stage of survey processing undertaken at head office was the replacement of any 'out-of-range' values on the data file with blanks. This process was designed to make further editing easier.

The second stage of survey processing involved subjecting individual survey records to a computer edit to determine which of the jobs reported by respondents had sufficient information to be retained. A total of 582 jobs were dropped at this stage because they did not meet the minimum specified requirement.

The third stage of survey processing involved editing all remaining survey records to identify errors, gaps and inconsistencies in the survey data. Four particular types of errors were treated, each of which are described below:

The first type of errors treated were errors of questionnaire flow, where questions which should not have been answered are found to contain answers. In this case a computer edit automatically eliminated superfluous data by following the flow of the questionnaire implied by answers to previous, and in some cases, subsequent questions.

The second type of errors treated were also errors of questionnaire flow, but in this case involved a lack of information in questions which should have been answered. Errors of this type were flagged in a computer edit and responses randomly imputed from similar records matched on a set of characteristics chosen to reflect likely variations in survey response. A total of 12,143 imputations of this type were required, on a total of 5,018 records.

The third type of errors treated involved incomplete reporting of job start dates, job end dates, and the dates of any work interruptions. Errors of this type were identified by a separate computer edit and missing values randomly imputed from similar records matched on a set of characteristics chosen to reflect underlying patterns of survey response. In this case, however, the incomplete dates were used to further restrict the possible set of donor records to those records with spells of similar durations. In total, 9,945 incomplete dates were imputed in this manner.

Errors of the fourth type involved cases where the information reported for individual jobs was found to be inconsistent or to leave periods in the reference year unaccounted for. These errors were identified by a third computer edit which derived and compared a weekly labour force status vector for all reported jobs. Wherever possible, this computer edit used other dates reported on the questionnaire to force agreement automatically. The balance of errors of this type were reviewed and corrected manually by a senior analyst. In each such case the record was cycled back through the edit to identify any residual errors.

In total, 3,421 edit failures of this type were identified of which 2,160 were corrected automatically by the edit program.

7.3 Weighting

The principle behind estimation in a probability sample such as the LFS is that each person in the sample "represents", besides himself or herself, several other persons not in the sample. For example in a simple random sample of 2% of the population, each person in the sample represents 50 persons in the population.

The weighting phase is a step which calculates, for each record, what this number is and places it on the microdata file for each record. This weight must be used to derive estimates from the microdata file. For example, if the number of persons who are married is to be estimated, it is done by selecting the records referring to persons with that characteristic and summing the weights of those records.

Details of the method used to calculate these sampling weights are presented in Appendix D.

7.4 Creation of Derived Variables

A number of data items on the microdata files have either been coded from open-ended responses recorded by interviewers or derived by combining a number of items on the questionnaire. The following section outlines how each of these variables was derived.

7.4.1 Coding of Industry and Occupation

For each job held by a respondent in 1986, the LMAS questionnaire collected information on the name of the employer, the kind of business, industry or service the employer was in, the kind of work done and the usual duties or responsibilities of the respondent in the job. This information was used to assign industry and occupation codes to each job using the 1980 version of Statistics Canada's Standard Industrial and Occupational Classifications.

Three different methods were used to assign these codes. If a particular job was the main job held by the respondent during the previous month (as identified from the previous month's LFS interview), the three-digit industry and the four digit occupation codes assigned by the regular LFS processing system were accepted. Of the 62,977 jobs identified by the survey, 49,828 were coded in this fashion.

Where a particular job was not assigned in this manner, the information on the name of the employer, etc. was put through the automated coding system used by the LFS and where a match to the database of descriptions was obtained, the appropriate industry and/or occupation codes were assigned. An additional 5,034 jobs were completely coded by this system.

The remaining 8,115 uncoded jobs were coded manually by a staff of experienced coders and the coded values linked to the survey data file.

7.4.2 Labour Force Status Vectors

The labour force status vectors are 65 position data fields, each position describing the labour force activity (i.e. working, looking for work, not in the labour force) of an individual in a particular week of the survey reference period. These were derived from edited LMAS questionnaire data.

The first 53 digits of each vector relates to the 53 calendar weeks of 1986 (starting with Sunday and ending with Saturday). Because data collection for the survey continued in some cases into March 1987, each vector contains data for an additional 12 weeks past the end of the 1986 calendar year to March 28, 1987. Therefore the total length of each vector is 65 digits representing 65 weeks.

The Job Status Vectors

A job status vector is calculated for each job held in 1986, showing working periods and interruptions or absences from jobs. There are "0"-s before the start of the job, and after termination of the job or after the week in which the survey data was collected, whichever is earlier. Weeks working at the job are indicated by "1"-s. One day of work in a week is sufficient to classify that week as a week of working at the job.

For weeks in which a person was on an interruption from a job or absent without pay, one of 26 alphabetic codes representing the reason for the interruption is inserted into the job status vector.

The first non-zero value in a job vector is a 1 except when the respondent indicated January 1, 1986 as the job start date and also as an interruption start date. In this case the "not working" status at the beginning of the reference period is reflected by the appropriate alphabetic value in the job status vector. Similarly persons absent from work at the time the survey was

conducted will have their job end with alphabetic values in the status vector.

The Composite Status Vector

To permit analysis of annual activity patterns and week-to-week transitions in labour force activity, a composite status vector was calculated from information on all jobs, job interruptions, and inter-job non-working periods. This vector provides a unique account of labour force activity for every week of the reference period.

The composite vector classifies each week of the reference period into one of the following labour force categories

- working at a job or self-employed (code 1)
- not working, and looking for work or on temporary lay-off (code 2)
- not working or looking for work but wanting a job (code 3)
- not working and not wanting a job (code 4)

Calculation of the composite labour force status vector begins with setting to 1-s positions corresponding to any week in which work was done, even for a day, in any of the person's jobs. Then vector values are set for interruptions in jobs and non-working periods between jobs based on whether job search was reported, length of continuous job search, whether there was a desire to work, and the reason for termination or stopping of work.

When calculating the composite vector of individuals with more than one job, information on individual jobs is combined using an LFS type hierarchical classification scheme. Thus work at one job overrides an absence from work at another job, given that both activities occur during the same week. Similarly job search activity before a job predominates over an absence from another job with no job search activity when determining a labour force category for a given week. For the period of the reference year in 1986 after the last job, monthly data on job search and

desire to work (Q75 and Q78) are converted to weekly statuses of 2, 3, or 4-s.

Zeros (not determined) would only appear in the composite vector after the week in which the survey data was collected or, in the case of people with no jobs that continued into 1987 after week 53.

A graphic illustration of the relationship of the job status vectors and the composite status vector for a hypothetical respondent is presented on the following page.

John Smith started working at JOB1 in 1985, working continuously until his union was locked out by the employer on March 14, 1986. The strike lasted until April 29, 1986. John returned to work on April 30th, only to be permanently laid off on May 23, 1986. After a period of job search, John started work at JOB 2 on a part-time on-call basis on June 23, 1986. After failing to be called in during the week of July 6, 1986, John decided to look for another job. John started JOB3 on September 8, 1986, but continued to work on an off and on JOB 2 until October 8, 1986, when he decided it wasn't worth the hassle of trying to hold down two jobs. John left JOB 3 on December 16, 1986 so that he could return to school full-time. He neither looked for or wanted work after his return to school in December.

7.4.3 Calculation of Total Hours Worked per Job, all Jobs

For each job held, the number of hours worked in the reference year is derived by summing the number of hours worked in each employment spell, assuming the usual work schedule reported in Q58, Q59 and Q60 for the four, week 28 day 'lunar' month. A month-specific correction factor has been incorporated into the calculation to reflect the actual number of days in the month as compared to a 'lunar' month. These job-specific totals are subsequently summed to yield a total hours worked at all jobs.

7.4.4 Calculation of Hourly Wage Rates for Paid Workers

For analytic convenience, any usual wage or salary which was not reported on an hourly basis has been converted to an hourly-equivalent wage rate. The following table shows the various calculations used in this conversion when the period to which the reported value applied was known.

Reported Pay Period	Formula used to Convert an Hourly Wage Rate
Daily	$Q67\$ / Q60$
Weekly	$Q67\$ / (Q59 \times 060)$
Bi-weekly	$Q67\$ / [(Q58 \times Q59 \times Q60) / 2]$
Twice a month	$Q67\$ / [(A.F. \times Q58 \times Q59 \times Q60) / 2]$
Monthly	$Q67\$ / [(A.F. \times Q58 \times Q59 \times Q60)]$
Yearly	$Q67\$ / [(A.F. \times Q58 \times Q59 \times Q60) \times 12]$

Q67\$ = dollar amount, to two decimal places
Q58 = number of weeks worked per month (1-4)
Q59 = number of days worked per week (1-7)
Q60 = number of hours worked per day (1-24)
A.F. = adjustment factor of 1.08631, i.e. $365/12 \times 4 \times 7$
carried to five decimal places

To calculate average hourly wage rates at the aggregate level or for particular sub-groups of the population (for example, by age, sex, industry, occupation, etc.), the following method is recommended:

$$\frac{\sum R_i w_i h_i}{\sum w_i h_i}$$

where R_i is the hourly wage rate for person i

w_i is the record weight for person i

h_i is the number of usual hours worked per week at the main job

\sum is a summation of all individual records in total or in a particular sub-group (i.e. by age, sex, etc.) for which a wage rate is being calculated.

This method compensates for the variation in hours worked among individuals by giving greater weight to those working longer hours. LMAS tabulations and analytical studies originating from Statistics Canada will be based on this method of calculating average hourly wage rates.

An alternative methodology is to omit the hours worked variable (h_i) from the above formula. This may be a more appropriate technique for some applications.

7.4.5 Calculation of Total Earnings from Paid Employment -All Paid Worker Jobs

To derive a total earnings from paid employment for all jobs the total earnings from each job is first computed by multiplying the hourly wage rate by the total hours worked in the reference year. These values are then summed to yield the 'all jobs' total.

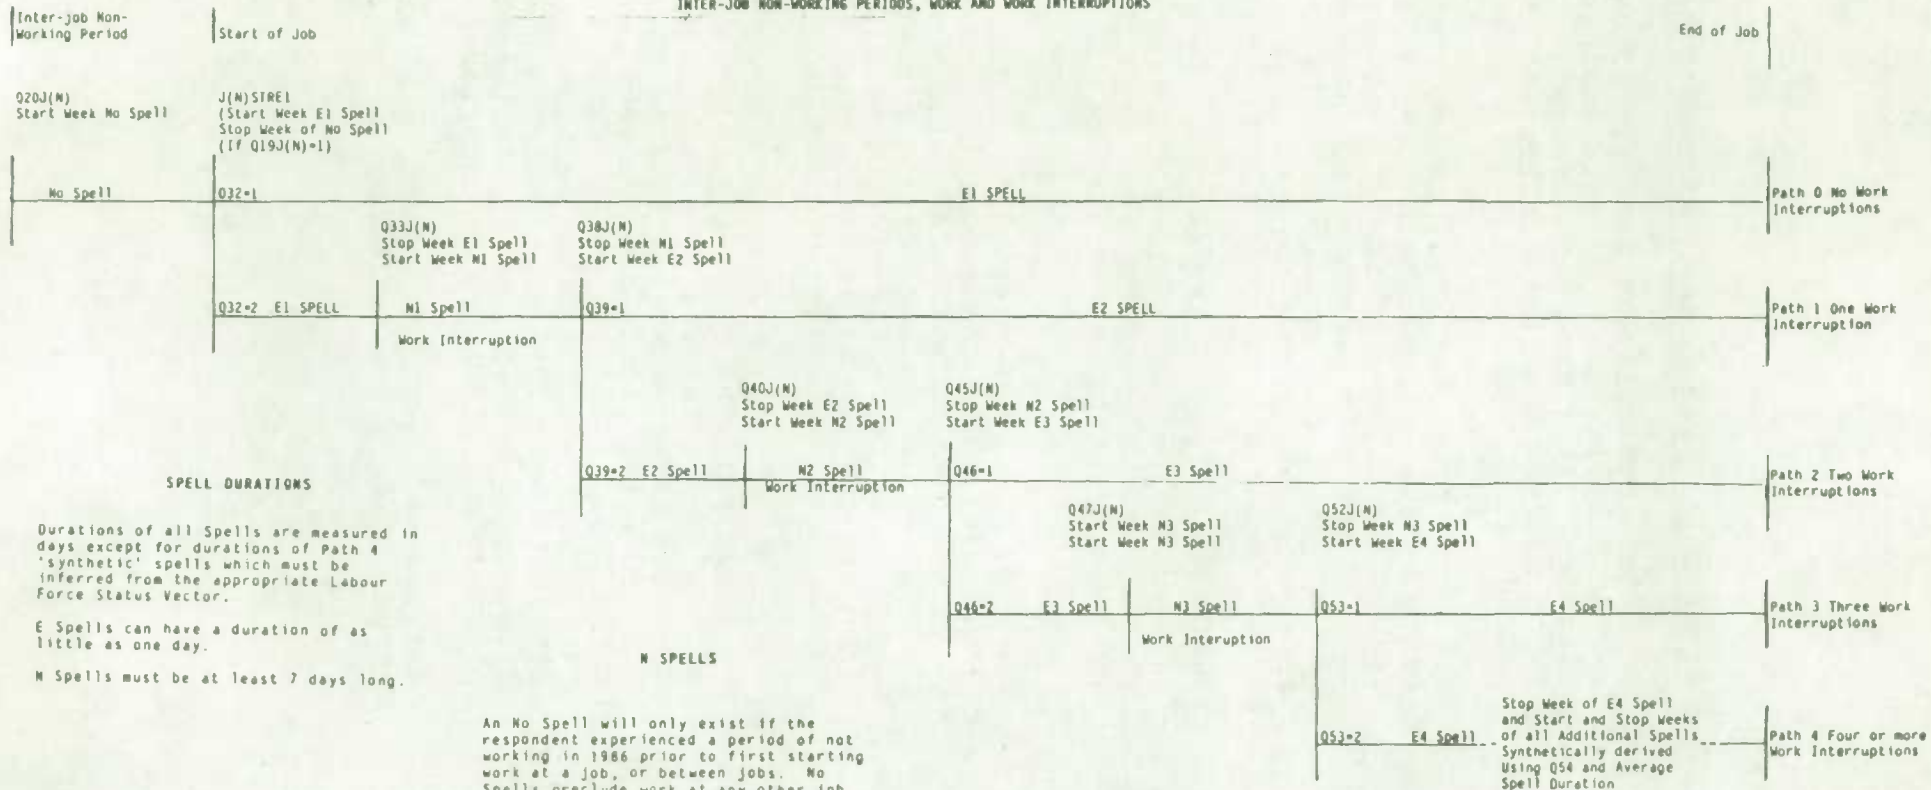

7.4.6 Derivation of Path Flag

For each job reported on the LMAS, an indicator has been created which defines the nature of the work pattern experienced in the reference year with regard

to that job. Each of the different work patterns possible is described as a 'path', indicating essentially the chronological flow of questions used in the interview. The following illustration shows how this indicator relates to the LMAS questionnaire and derived variables on the microdata files.

THE LABOUR MARKET ACTIVITY SURVEY
AS PRESENTED ON THE PERSON FILE AND JOB FILE

INTER-JOB NON-WORKING PERIODS, WORK AND WORK INTERRUPTIONS

SPELL DURATIONS

Durations of all Spells are measured in days except for durations of Path 4 'synthetic' spells which must be inferred from the appropriate Labour Force Status Vector.

E Spells can have a duration of as little as one day.

N Spells must be at least 7 days long.

N SPELLS

An No Spell will only exist if the respondent experienced a period of not working in 1986 prior to first starting work at a job, or between jobs. No Spells preclude work at any other job during this period.

No Spells have detail on the incidence and weeks of continuous job search undertaken, job search methods used, the desire for work in the absence of job search, labour market problems experienced in looking for work, and availability for work are identified.

E SPELLS

Each E Spell ending in 1986 is accompanied by a detailed reason for the work interruption or for stopping work.

Creation of 'Public-use' Microdata Files

In order to facilitate analysis of data from the Labour Market Activity Survey, three separate public-use microdata files have been created. Detailed record layouts of each of these files are included as Appendices E, F and G.

The first of these files, called the 'person file' contains all information pertaining to a particular respondent on one physical record. This file would be used to estimate person level characteristics, such as the number of persons experiencing unemployment in the reference year or the number of persons holding at least one unionized job in 1986.

The second file, called the 'job file', contains all information pertaining to a job held by an individual in 1986, as well as the same personal characteristics and summary variables carried on the person file.

The 'job file' was created to simplify tabulation in studies for which the job, rather than the person, is to be the unit of analysis. This file would be used to generate estimates such as the number of jobs which are paying at or below the minimum wage, the number of jobs which are covered by a pension plan or a collective agreement or the number of jobs held by students.

The third file, called the 'spell file', contains all information pertaining to a particular spell or period of labour market activity related to a job, as well as selected person level and job level characteristics. On the 'spell' file, a spell record is created for every intra-job transition between work and work interruptions. This file would be used to generate estimates of average spell duration by reason for work interruptions, industry, occupation, etc.

An illustration of the structure of each of these files may be found on the following two pages.

The person file contains all information pertaining to a particular individual. The record illustrated below is for a person who held three jobs in 1986. A five-digit person id, found in the first five bytes of the record, uniquely identifies each of these records.

PERSON ID	DEMOGRAPHIC INFORMATION (Such as age, sex, including school attendance)	SUMMARY DATA ON LABOUR MARKET PARTICIPATION IN 1986 (Such as total earnings from all jobs, income sources, composite labour force status vector, number of jobs held, number of employers)	JOB WORK PATTERN AND JOB CHARACTERISTICS FOR JOB 1	JOB WORK PATTERN AND JOB CHARACTERISTICS FOR JOB 2	JOB WORK PATTERN AND JOB CHARACTERISTICS FOR JOB 3	JOB WORK PATTERN AND JOB CHARACTERISTICS FOR JOB 4	JOB WORK PATTERN AND JOB CHARACTERISTICS FOR JOB 5	JOB SEARCH, THE DESIRE FOR WORK AND LABOUR MARKET PROBLEMS EXPERIENCED IN PERIODS NOT ACCOUNTED FOR BY JOBS	RECORD WEIGHT
00001			1	2	3	0 Blank	0 Blank		

The job file includes a separate record for each job held by the respondent, duplicating the demographic information, the all-jobs summary data, the data for any periods not accounted for by jobs and the record weight. Job records are uniquely identified by job id, found in position 249, within person id. For persons who did not work in the reference year, a "dummy" job record has been included on the job file. The job id on these records will be zero.

PERSON ID	DEMOGRAPHIC INFORMATION (Such as age, sex, including school attendance)	SUMMARY DATA ON LABOUR MARKET PARTICIPATION IN 1986 (Such as total earnings from all jobs, income sources, composite labour force status vector, number of jobs held, number of employers)	JOB WORK PATTERN AND JOB CHARACTERISTICS FOR JOB 1	JOB SEARCH, THE DESIRE FOR WORK AND LABOUR MARKET PROBLEMS EXPERIENCED IN PERIODS NOT ACCOUNTED FOR BY JOBS	RECORD WEIGHT
00001			1		

PERSON ID	DEMOGRAPHIC INFORMATION (Such as age, sex, including school attendance)	SUMMARY DATA ON LABOUR MARKET PARTICIPATION IN 1986 (Such as total earnings from all jobs, income sources, composite labour force status vector, number of jobs held, number of employers)	JOB WORK PATTERN AND JOB CHARACTERISTICS FOR JOB 2	JOB SEARCH, THE DESIRE FOR WORK AND LABOUR MARKET PROBLEMS EXPERIENCED IN PERIODS NOT ACCOUNTED FOR BY JOBS	RECORD WEIGHT
00001			2		

PERSON ID	DEMOGRAPHIC INFORMATION (Such as age, sex, including school attendance)	SUMMARY DATA ON LABOUR MARKET PARTICIPATION IN 1986 (Such as total earnings from all jobs, income sources, composite labour force status vector, number of jobs held, number of employers)	JOB WORK PATTERN AND JOB CHARACTERISTICS FOR JOB 3	JOB SEARCH, THE DESIRE FOR WORK AND LABOUR MARKET PROBLEMS EXPERIENCED IN PERIODS NOT ACCOUNTED FOR BY JOBS	RECORD WEIGHT
00001			3		

PERSON ID	DEMOGRAPHIC INFORMATION (Such as age, sex, including school attendance)	SUMMARY DATA ON LABOUR MARKET PARTICIPATION IN 1986 (Such as total earnings from all jobs, income sources, composite labour force status vector, number of jobs held, number of employers)	JOB WORK PATTERN AND JOB CHARACTERISTICS (if any)	JOB SEARCH, THE DESIRE FOR WORK AND LABOUR MARKET PROBLEMS EXPERIENCED IN PERIODS NOT ACCOUNTED FOR BY JOBS	RECORD WEIGHT
00001			0 Blank		

7.6

Suppression of Confidential Information

It should be noted that the 'Public Use' microdata files described above differ in a number of important respects from the survey 'master' files held by Statistics Canada. These differences are the result of actions taken to protect the anonymity of individual survey respondents. Users requiring access to information excluded from the microdata files may purchase custom tabulations. Estimates generated will be released to the user subject to meeting the publication and release guidelines outlined in Section 10 of this document.

1) Suppression of Geographic Identifiers

The LMAS master data files include explicit geographic identifiers for province, economic regions and Census Metropolitan Areas. It is also possible to obtain, where sample sizes permit, estimates by urban size class, for Census Divisions or for Canada Employment Centre service territories.

The LMAS public-use microdata files do not contain any geographic identifiers below the provincial level.

2) Suppression of Family Identifiers

The LMAS master data files allow the aggregation of individuals into economic families, and economic families into households. The LMAS public-use microdata files do not allow for such aggregation.

3) Grouping of Industry and Occupation Codes

Each job reported on the LMAS master data files have been assigned a three-digit 1980 Standard Industrial Code and a four-digit 1980 Standard Occupational Code. On the public-use microdata files each of these detailed codes have been collapsed into 52 and 49 groups respectively (see Appendices H and I).

4) Suppression of Actual Dates

The dates upon which jobs and interruptions began and ended have not been included on the public-use microdata file. Actual dates have been replaced with a value which represents the week in which the event

occurred, using the week beginning Sunday, December 31, 1900 as the reference point. In this schema, January 1, 1986 has a value of 4435 and January 1, 1987, a value of 4487.

5) Capping of Extreme Wage Rates and Associated Variables

Two records with computed total earnings from all jobs in 1986 in excess of \$150,000 have had their hourly wage rates reduced to values which yield totals close to \$150,000.

6) Masking of Firm Size

In order not to identify unique firms within industry and province, a single variable has been created and placed in Q70TOT which reflects the firm size for single location employers, and the establishment size for multi-location employers. Q68EMP and Q69LOC have been suppressed completely.

In addition to these suppressions, the derived firm size variable has been selectively masked in 4 cases where a work interruption due to strike or lockout would have uniquely identified a particular firm within industry and province.

7) Grouping of Actual Age

Actual age on the LMAS survey master file have been grouped into five year ranges.

8) Grouping of Educational Attainment

Detail on actual years of primary and secondary schooling has been grouped into a five-category educational-attainment variable.

9) Grouping of Marital Status

The master file marital status categories of 'widowed', 'separated or divorced' and 'other' have been collapsed into one category.

8.

SAMPLING ERROR

The estimates that can be derived from this survey are based on a sample of individuals. Somewhat different estimates might be obtained if a complete census had been taken using the same questionnaire, interviewers, supervisors, processing methods, etc. as those actually used. The difference between the estimates obtained from the sample and those resulting from a complete count taken under similar conditions is called the sampling error of the estimates.

Since it is an unavoidable fact that estimates from a sample survey are subject to sampling error, sound statistical practice calls for researchers to provide users with some indication of the magnitude of this sampling error. This section of the documentation outlines the measures of sampling error which Statistics Canada commonly uses and which it urges users producing estimates from this microdata file to use also.

The basis for measuring the potential size of sampling errors is the standard error of the estimates derived from survey results.

However, because of the large variety of estimates that can be produced from a survey such as this, the standard error of an estimate is usually expressed relative to the estimate to which it pertains. This resulting measure, known as the coefficient of variation of an estimate, is obtained by dividing the standard error of the estimate by the estimate itself and is expressed as a percentage of the estimate.

For example, suppose that, based upon the survey results, one estimates that 6% of persons aged 16-69 were unemployed throughout 1986 and that this estimate is found to have standard error of .009. Then the coefficient of variation of the estimate is calculated as

$$\frac{.009}{.06} \times 100\% = 15\%$$

Before discussing how these measures can be obtained it is useful to describe the two main types of point estimates of population characteristics which can be generated from the microdata files for the Labour Market Activity Survey.

(1) Qualitative Estimates

Qualitative estimates are estimates of the number, proportion or percentage of the surveyed population possessing certain characteristics or falling into some defined category. The number of persons aged 16-69 who were employed at some time in 1986 or the proportion of Ontario's population that consists of females earning more than \$40,000 in wages and salaries from paid employment in 1986 are examples of such estimates.

In this context, an estimate of the number of persons possessing a certain characteristic is referred to as an estimate of an aggregate.

(2) Quantitative Estimates

Quantitative estimates are estimates of totals or of means, median and other measures of central tendency based upon some or all of the members of the surveyed population. They also specifically involve estimates of the form \hat{x}/\hat{y} where \hat{x} is an estimate of surveyed population total and \hat{y} is an estimate of the number of persons in the surveyed population contributing to that total.

An example of a quantitative estimate based upon all members in surveyed population is the mean age in 1986 of Canadians aged 16-69. Similarly, the mean weekly wage or salary of female paid employees aged 16-69 is an example of a quantitative estimate since it's numerator is an estimate of the total wages/salaries for all female paid employees in the surveyed population and its denominator is an estimate of the number of female paid employees in the surveyed population.

8.1

Where to Obtain Coefficients of Variation for Qualitative Estimates

In order to supply coefficients of variation which would be applicable to a wide variety of qualitative estimates produced from these microdata tapes and which could be readily accessed by the user, a set of 'look up' tables, referred to as Sampling Variability Tables, has been produced and included as Appendix J.

There is one set of tables pertaining to person characteristics (which are to be used in conjunction with estimates derived from the person microdata file) and a second set of tables pertaining to job characteristics (which are to be used in conjunction with estimates derived from the job microdata file). Within each set, there are individual tables for each of the provinces as well as for Canada. It is to be noted that all coefficients of variation in these tables are approximate and, therefore, unofficial.

These coefficients of variation are derived using the variance formula for simple random sampling and incorporating a factor which reflects the multi-stage, clustered nature of the sample design. This factor, known as the design effect, has been determined by first calculating design effects for a wide range of characteristics and then choosing from among these a conservative value which will not give a false impression of high precision. Estimates of actual variance for specific variables may be obtained from Statistics Canada on a cost-recovery basis. As noted in Section 10.3, use of actual variance estimates allows users to release otherwise unreleaseable estimates, i.e. estimates with coefficients of variation in the 'restricted' range.

The following rules should enable the user to determine the approximate coefficients of variation from the Sampling Variability Tables for estimates of the number, proportion or percentage of the surveyed population possessing a certain characteristic and for ratios and differences between estimates.

Rule 1: Estimates of Numbers Possessing a Characteristic (Aggregates)

The coefficient of variation depends only on the size of the estimate itself. On the Sampling Variability Table for the appropriate unit of analysis (person or job) and the appropriate geographic area, locate the estimated number in the left-most column of the table (headed "Numerator of Percentage") and follow the asterisks (if any) across to the first figure encountered. This figure is the approximate coefficient of variation.

Rule 2: Estimates of Proportions or Percentages Possessing a Characteristic

The coefficient of variation of an estimated proportion or percentage depends on both the size of the proportion or percentage and the size of the total upon which the proportion or percentage is based. Estimated proportions or percentages are relatively more reliable than the corresponding estimates of the numerator of the proportion or percentage, particularly if the percentages are .5 (or 50%) or more. (Note that in the tables the cv's decline in value reading from left to right).

When the proportion or percentage is based upon the total population of the geographic area covered by the table, the cv of the proportion or percentage is the same as the cv of the numerator of the proportion or percentage. In this case, Rule 1 can be used.

When the proportion or percentage is based upon a subset of the total population (e.g. those in a particular agegroup), reference should be made to the proportion or percentage (across the top of the table) and to the numerator of the proportion or percentage (down the left side of the table). The intersection of the appropriate row and column gives the coefficient of variation.

Rule 3: Estimates of Differences Between Aggregates or Percentages

The standard error of a difference between two estimates is approximately equal to the square root of the sum of squares of each standard error considered separately. That is, the standard error of a difference

$$\hat{d} = \hat{X}_1 - \hat{X}_2$$

is
$$\sigma_{\hat{d}} = \sqrt{(\hat{X}_1 \alpha_1)^2 + (\hat{X}_2 \alpha_2)^2}$$

where \hat{X}_1 is estimate 1, \hat{X}_2 is estimate 2, and α_1 and α_2 are the coefficients of variation of \hat{X}_1 and \hat{X}_2 respectively. The coefficient of variation of \hat{d} is given by $\sigma_{\hat{d}}/\hat{d}$. This formula is accurate for the difference between separate and uncorrelated characteristics but is only approximate otherwise.

Rule 4: Estimates of Ratios

In the case where the numerator is a subset of the denominator, the ratio should be converted to a percentage and Rule 2 applied. This would apply, for example, to the case where the denominator is the number of males and the numerator is the number of males who had a full-time job (for a given reference period).

In the case where the numerator is not a subset of the denominator, the standard error of the ratio of the two estimates is approximately equal to the square root of the sum of squares of each standard error considered separately. That is, the standard error of a ratio

$$\hat{R} = \hat{X}_1/\hat{X}_2$$

is
$$\sigma_{\hat{R}} = \sqrt{(\hat{X}_1 \alpha_1)^2 + (\hat{X}_2 \alpha_2)^2}$$

where \hat{X}_1 is the numerator, \hat{X}_2 the denominator, and α_1 and α_2 are the coefficients of variation of \hat{X}_1 and \hat{X}_2 respectively.

The coefficient of variation of \hat{R} is given by $\sigma_{\hat{R}}/\hat{R}$. The formula will tend to overstate the error if \hat{X}_1 and \hat{X}_2 are positively correlated and understate the error if \hat{X}_1 and \hat{X}_2 are negatively correlated.

Rule 5: Estimates of Differences of Ratios

In this case, Rules 3 and 4 are combined. The cv's for the two ratios are first determined using Rule 4, and then the cv of their difference is found using Rule 3.

The following two 'real life' examples are included to assist users in applying the foregoing rules.

Example 1

Suppose that a user estimates from the person microdata file that 27,300 females in Manitoba employed part-time at one job in 1986 had no work interruptions from that job in 1986. How does the user determine the coefficient of variation of this estimate?

- (1) Refer to the person characteristics table for Manitoba
- (2) The estimated aggregate, 27,300, does not appear in the left-hand column (the 'Numerator of Percentage' column), so it is necessary to use the figure closest to it, namely 25,000
- (3) The coefficient of variation for an estimated aggregate of is found by referring to the first non-asterisk entry on that row, namely, 7.7%
- (4) So the approximate coefficient of variation of the estimate is 7.7%

Example 2

Suppose that the user estimates that 85.3% of females in Manitoba employed part-time at one job in 1986 had no work interruptions from that job in 1986. This is the expression of the estimate obtained in Example 1 as a percentage of all Manitoba women aged 16-69 and employed part-time. How does the user determine the coefficient of variation of this estimate?

- (1) Refer to the person characteristic table for Manitoba
- (2) Because the estimate is a percentage which is based on a subset of the total population (i.e., females employed part-time), it is necessary to

use both the percentage (85.3%) and the numerator portion of the percentage (27,300) in determining the coefficient of variation.

- (3) The numerator, 27,300, does not appear in the left-hand column (the 'Numerator of Percentage' column) so it is necessary to use the figure closest to it, namely 25,000. Similarly, the percentage estimate does not appear as any of the column headings, so it is necessary to use the figure closest to it, namely, 90.0%.
- (4) The figure at the intersection of the row and column used, namely, 2.5% is the coefficient of variation to be used.
- (5) So the approximate coefficient of variation of the estimate is 2.5%

8.2

How to Obtain Coefficients of Variation for Quantitative Estimates

For quantitative estimates, special tables would have to be produced to determine their sampling error. Since the variables for the Labour Market Activity Survey are primarily qualitative in nature, this has not been done.

As a general rule, however, the coefficient of variation of a quantitative total will be larger than the coefficient of variation of the corresponding qualitative estimate (i.e., the estimate of the number of persons contributing to the quantitative estimates). If the corresponding qualitative estimate is not releasable, the quantitative estimate will not be either.

Coefficients of variation of such estimates can be derived as required for a specific estimate using a technique known as pseudo replication. This involves randomly dividing the records on the microdata files into subgroups (or replicates) and determining the variation in the estimate from replicate to replicate. Users wishing to derive coefficients of variation for quantitative estimates may contact Statistics Canada for advice on the allocation of records to appropriate replicates and the formulae to be used in these calculations.

8.3

Confidence Limits

Although coefficients of variation are widely used, a more intuitively meaningful measure of sampling error is the confidence interval of an estimate. A confidence interval constitutes a statement on the level of confidence that the true value for the population lies within a specified range of values. For example a 95% confidence interval can be described as follows:

If sampling of the population is repeated indefinitely, each sample leading to a new confidence interval for an estimate, then in 95% of the samples the interval will cover the true population value.

Using the standard error of an estimate, confidence intervals for estimates may be obtained under the assumption that under repeated sampling of the population, the various estimates obtained for a population characteristic are normally distributed about the true population value. Under this assumption, the chances are about 68 out of 100 that the difference between a sample estimate and the true population value would be less than one standard error, about 95 out of 100 that the difference would be less than two standard errors, and about 99 out of 100 that the differences would be less than three standard errors. These different degrees of confidence are referred to as the confidence levels.

Confidence intervals for an estimate, \hat{X} , are generally expressed as two numbers, one below the estimate and one above the estimate, as $(\hat{X}-k, \hat{X}+k)$ where k is determined depending upon the level of confidence desired and the sampling error of the estimate.

Confidence intervals for an estimate can be calculated directly from the Sampling Variability Tables by first determining from the appropriate table the coefficient of variation of the estimate \hat{X} , and then using the following formula to convert to a confidence interval CI:

$$CI_X = \left\{ \hat{X} - t(\hat{X}) \alpha_{\hat{X}}, \hat{X} + t(\hat{X}) \alpha_{\hat{X}} \right\}$$

where $\alpha_{\hat{X}}$ is the determined coefficient of variation of \hat{X}

- t = 1 if a 68% confidence interval is desired
- t = 2 if a 95% confidence interval is desired
- t = 3 if a 99% confidence interval is desired

9. NON-SAMPLING ERROR

Errors which are not related to sampling may occur at almost every phase of a survey operation. Interviewers may misunderstand instructions, respondents may make errors in answering questions, the answers may be incorrectly entered on the questionnaire and errors may be introduced in the processing and tabulation of the data. These are all examples of non-sampling errors.

Over a large number of observations, randomly occurring errors will have little effect on estimates derived from the survey. However, errors occurring systematically will contribute to biases in the survey estimates. Considerable time and effort has been made to reduce non-sampling errors in the LMAS. Quality control measures have been implemented at each step of the data collection and processing cycle to monitor the quality of the data. These measures include the use of highly skilled interviewers, extensive training of interviewers with respect to the LMAS procedures and questionnaire, observation of interviewers to detect problems of questionnaire design or misunderstanding of instructions, procedures to ensure that data capture errors are minimized and coding and edit quality checks to verify the processing logic. Despite these efforts non-sampling error is bound to have some impact on LMAS estimates. The following section outlines the most likely sources of this error and its probable impact on the survey estimates.

9.1 Total Non-response

Total non-response is a major source of non-sampling error in many surveys. In the LMAS total non-response occurs because the household could not be contacted, no member of the household was able to provide the information, or members of the household refused to participate in the survey. The non-response rate for the LMAS in January/February 1987 was 9.6% which includes 4.1% of households which did not respond to the LFS. Total non-response is handled by adjusting the household sampling weight of responding households to compensate for missing households or missing individuals within responding households. Analysis of the characteristics of LMAS non-respondents suggest that total non-response is not a major source of non-sampling error.

9.2

Partial Non-response

Partial non-response in the LMAS may occur if the respondent refuses to answer a question, does not understand a question or, in the case of proxy reporting, if the person reporting does not know the answer to a question. Generally, partial non-response was not a problem in the LMAS. As a result, it is unlikely that partial non-response contributed significantly to non-sampling error. Two notable exceptions are discussed below.

Missing "Days"

The LMAS asks questions requiring detailed information regarding the dates that certain work activities began and ended. During processing, dates which contained at least the month and year were considered to be valid. "Day" values missing from any pair of dates defining a spell of labour market activity were imputed randomly from spells of similar duration drawn from donor records matched on demographic and labour market characteristics. This procedure was designed to preserve the distribution of spell durations within the demographic/labour market classes used, but does not guarantee that the distribution of the actual start or stop dates will be preserved. As a result, users interested in the exact timing of certain events, such as seasonal lay-offs, should contact Statistics Canada for more information about the impact of this imputation on their analysis.

Missing "Wage or Salary"

At 9%, the item non-response rates for LMAS items pertaining to wage or salary information are considerably higher than observed for any other variables collected. The method used to impute a value in these cases was designed to preserve the distributions of hourly wage equivalents within broad demographic and labour market groups. As a result, users may notice a blurring of the wage distribution within the detailed occupational or industrial codes provided.

Other Sources of Non-sampling Error

A number of other known sources of non-sampling error have been identified during the course of data processing and evaluation. Although the impact on the overall quality of the estimates is thought to be small, detailed analysis of specific groups, such as "students", may be influenced to a much greater extent.

Estimates Based on "Usual Work Schedule" Items

The questions pertaining to the work schedule (Q58, Q59, Q60) require a response rounded to a whole number. Thus, persons who reported working 7.5 hours a day would have had this value rounded to 8 hours per day. This could cause an overestimate of the total number of hours worked in the year of up to 7% for a five days per week full year worker. In the absence of evidence to the contrary, however, one might expect that errors due to rounding up in the work schedule items will tend to be offset by those due to rounding down.

The work schedule questions also require respondents to report a usual work schedule for the entire period they held the job. This can be a very difficult task for those respondents who experienced repeated periods of overtime and/or short hours, and a certain amount of "averaging" error is to be expected.

Estimates Based on "Usual Wage or Salary" Items

Item 67 asked respondents to report their usual gross wage or salary, including tips and commissions, for each paid job held in the reference year. In cases in which respondents reported a dollar amount, a rate and some form of secondary remuneration without placing an absolute value on the secondary source (e.g., \$40/day plus a share of the catch, \$450/week + 5% commission) the hourly rate of pay reflects only the dollar amount reported. As a result, hourly wage rates will be biased downward for these groups.

Cases were also encountered in which respondents reported a piece rate without specifying the number of units to which it applied (e.g., \$40/cord cut, \$1/pint picked, \$0.35/mile driven). Although such cases were randomly imputed from donor records with similar demographic and labour market characteristics, the matching criterion used in this imputation did not

control for the very specific industries and occupation involved.

LMAS also identified a small number of cases of individuals working in sheltered workshops in which the wage rate was considerably below that being paid by the "open" market. Inclusion of these individuals in calculations of average wage rates will tend to draw down the calculated averages.

A small number of individuals reported having jobs which required being "on duty" 24 hours a day (e.g., priests, camp counsellors, offshore roustabouts). Inclusion of these individuals in average wage rate calculations will also tend to draw down the calculated averages.

It should also be noted that fringe benefits, outside of payment in kind, were not covered by this survey. An individual's effective wage or salary is usually more accurately reflected by the total compensation received, since more extensive fringe benefits are often granted in lieu of higher earnings.

Estimates of Participation in Canadian Jobs Strategy Programs

Item 104 was designed to identify participation in programs sponsored by Employment and Immigration Canada under the Canadian Jobs Strategy. Such identification is notoriously difficult, largely due to the fact that participants have difficulty recalling the exact name of the program in which they are enrolled. The LMAS proved to be no exception to this rule with 173 respondents reporting participation in the non-existent "Work Experience Program", which had been added to provide a measure of response quality. As a result, users should exercise caution when analysing individual CJS programs.

10.

PUBLICATION AND RELEASE GUIDELINES

IT IS IMPORTANT FOR USERS TO BECOME FAMILIAR WITH THE CONTENTS OF THIS SECTION BEFORE PUBLISHING OR OTHERWISE RELEASING ANY ESTIMATES DERIVED FROM THE MICRODATA TAPES OF THE LABOUR MARKET ACTIVITY SURVEY.

This section of the documentation outlines the guidelines to be adhered to by users publishing or otherwise releasing any data derived from the survey microdata tapes. With the aid of these guidelines, users of microdata should be able to produce the same figures as those produced by Statistics Canada and, at the same time, will be able to develop currently unpublished figures in a manner consistent with these established guidelines. This section consists basically of four sub-sections - the rounding guidelines, the sample weighting guidelines and the sampling variability guidelines and guidelines for statistical analysis.

10.1

Rounding Guidelines

In order that estimates for publication or other release derived from these microdata tapes will correspond to those produced by Statistics Canada, users are urged to adhere to the following guidelines regarding the rounding of such estimates.

- a) Estimates in the main body of a statistical table are to be rounded to the nearest thousand units using the normal rounding technique. In normal rounding, if the first or only digit to be dropped is 0 to 4, the last digit to be retained is not changed. If the first or only digit to be dropped is 5 to 9, the last digit to be retained is raised by one. For example, in normal rounding to the nearest 1000, if the last three digits are between 000 and 499, they are changed to 000 and the preceding digit (the thousands digit) is left unchanged. If the last digits are between 500 and 999 they are changed to 000 and the preceding digit is incremented by 1.
- b) Marginal sub-totals and totals in statistical tables are to be derived from their corresponding unrounded components and then are to be rounded themselves to the nearest 1000 units using normal rounding.

- c) Averages, proportions, rates and percentages are to be computed from unrounded components (i.e. numerators and/or denominators) and then are to be rounded themselves to one decimal using normal rounding. In normal rounding to a single digit, if the final or only digit to be dropped is 0 to 4, the last digit to be retained is not changed. If the first or only digit to be dropped is 5 to 9, the last digit to be retained is increased by 1.
- d) Sums and differences of aggregates or ratios are to be derived from their corresponding unrounded components and then are to be rounded themselves to the nearest 1000 units or the nearest one decimal using normal rounding.
- e) In instances where, due to technical or other limitations, a rounding technique other than normal rounding is used resulting in estimates to be published or otherwise released which differ from corresponding estimates published by Statistics Canada, users are urged to note the reason for such differences in the publication or release document(s).
- f) Under no circumstances are unrounded estimates to be published or otherwise released by users. Unrounded estimates imply greater precision than actually exists.

10.2

Sample Weighting Guidelines for Tabulation

The sample design used for the Labour Market Activity Survey was not self-weighting. When producing simple estimates, including the production of ordinary statistical tables, users must apply the sampling weights placed on the individual microdata tape records. Otherwise, the estimates derived from the microdata tapes cannot be considered to be representative of the survey population, and will not correspond to those produced by Statistics Canada.

Users should also note that some software packages because of their treatment of the weight field, may not allow the generation of estimates that exactly match those available from Statistics Canada.

10.3 Sampling Variability Guidelines

Before releasing and/or publishing any estimate from these microdata tapes, users should determine its coefficient of variation and follow the guidelines below.

Sampling Variability Guidelines for The Labour Market Activity Survey

Type of Estimate	cv (in %)	Guidelines
1. Unqualified	0.0 - 16.5	Estimates can be considered for general unrestricted release. Requires no special notation.
2. Qualified	16.6 - 25.0	Estimates can be considered for general unrestricted release but should be accompanied by a warning cautioning subsequent users of the high sampling variability associated with the estimates. Such estimates should be identified by the letter Q (or in some other similar fashion).
3. Confidential	25.1 - 33.3	Estimates can be considered for general unrestricted release only when sampling variabilities are obtained using an exact variance calculation procedure. Unless such variances are obtained, such estimates should be deleted and replaced by dashes (---) in statistical tables.
4. Not for Release	(i) 33.4 or greater OR (ii) any estimate of 4000 (after rounding regardless of cv	Estimates cannot be released in any form under any circumstances. In statistical tables, such estimates should be deleted and replaced by dashes (--).

Note: These sampling variability guidelines should be applied to rounded estimates.

Guidelines for Statistical Analysis

The LMAS is based upon a complex design, with stratification and multiple stages of selection, and unequal probabilities of selection of respondents. Using data from such complex surveys presents problems to analysts because the survey design and the selection probabilities affect the estimation and variance calculation procedures that should be used.

While many analysis procedures found in statistical packages allow weights to be used, the meaning or definition of the weight in these procedures differ from that which is appropriate in a sample survey framework, with the result that while in many cases the estimates produced by the packages are correct, the variances that are calculated are almost meaningless.

For many analysis techniques (for example linear regression, logistic regression, estimation of rates and proportions and analysis of variance), a method exists which can make the variances calculated by the standard packages more meaningful. If the weights on the data are rescaled so that the average weight is one (1), then the variances produced by the standard packages will be more reasonable; they still will not take into account the stratification and clustering of the sample's design, but they will take into account the unequal probabilities of selection. The rescaling can be accomplished by dividing each weight by the overall average weight before the analysis is conducted.

COMPLETING THE FORM 08
<ul style="list-style-type: none"> • Introduce the survey to the regular LFS respondent by saying: "Statistics Canada is doing this survey at the request of Employment and Immigration Canada. The purpose is to collect extra information about the patterns of work and the types of jobs held during 1986. All information will be kept strictly confidential as required by the Statistics Act". • Proxy response can be accepted for the Form 08. However when the person responding for other household members is unsure of the answers to the supplementary questions, arrangements should be made to telephone at a convenient time when the correct information can be obtained, either directly from the person concerned, or from a knowledgeable and responsible household member. • Respondents are asked to report on up to 5 jobs held in 1986. A respondent is considered to have changed jobs if he/she: <ul style="list-style-type: none"> (a) changed employers or; (b) experienced a change in usual duties for an employer which was accompanied by an increase or decrease in usual wages or salary. • To assist in recontacting households in January 1988 which may have moved in the interim you should attempt to obtain the name, address and telephone number of a person not living in the household.
9. START TIME <input type="text"/> <input type="text"/> <input type="text"/>
10. IN 1986, HOW MANY EMPLOYERS DID ... WORK FOR, INCLUDING SELF-EMPLOYMENT?
<input type="text"/> <input type="text"/> If <input type="text" value="0"/> <input type="text" value="0"/> Goto 90
11. DID ... HAVE MORE THAN ONE JOB WITH THIS/ANY OF THESE EMPLOYER(S) DURING 1986?
WE COUNT JOBS FOR THE SAME EMPLOYER AS BEING DIFFERENT IF THEY DIFFER BOTH IN THEIR USUAL DUTIES AND IN THE WAGE OR SALARY PAID.
Yes <input type="radio"/> No <input type="radio"/>

Weighting Procedures for
The Labour Market Activity Survey

APPENDIX D

WEIGHTING PROCEDURES FOR THE LABOUR MARKET ACTIVITY SURVEY

Since the Labour Market Activity Survey used a subsample of the LFS sample, the derivation of weights for the survey records is clearly tied to the weighting procedure used for the LFS. The LFS weighting procedure is briefly described below.

D .1 LFS Weighting

In the LFS, the final weight attached to each record is the product of the following factors: the basic weight, the cluster sub-weight, the balancing factor for non-response, the rural-urban factor and the province-age-sex ratio adjustment factor. Each is described below.

D.2 Basic Weight

In a probability sample, the sample design itself determines weights which must be used to produce unbiased estimates of the population. Each record must be weighted by the inverse of the probability of selecting the person to whom the record refers (in the example of a 2% simple random sample, this probability would be .02 for each person and the records must be weighted by $1/.02=50$). Because all eligible individuals in a dwelling are interviewed (directly or by proxy), this probability is essentially the same as the probability with which the dwelling is selected.

D.3 Cluster Sub-weight

The cluster delineation is such that the number of dwellings in the sample increases very slightly with moderate growth in the housing stock. Substantial growth can be tolerated in an isolated cluster before the additional sample represents a field collection problem. However, if growth takes place in more than one cluster in an interviewer assignment, the cumulative effect of all increases may create a workload problem. In clusters where substantial growth has taken place, sub-sampling is used as a means of keeping interviewer assignments manageable. The cluster sub-weight represents the inverse of this sub-sampling ratio in clusters where sub-sampling has occurred.

D.4 Non-response

Notwithstanding the strict controls of the LFS, some non-response is inevitable, despite all the attempts made by the interviewers. The LFS non-response rate is approximately 5%. For certain types of non-response (household temporarily absent, refusal), data from a previous month's interview with the household if any, is brought forward and used as the current month's data for the household.

In other cases, non-response is compensated for by proportionally increasing the weights of responding households. The weight of each responding record is increased by the ratio of the number of households that should have been interviewed, divided by the number that were actually interviewed. This adjustment is done separately for geographic areas called balancing units. It is based on the assumption that the households that have been interviewed represent the characteristics of those that should have been interviewed. To the extent that this assumption is not true, the estimates will be somewhat biased.

D.5 Rural-urban Factor

In NSRUs without sufficient rural and urban population for explicit urban and rural strata to be formed, each primary sampling unit (PSU) is composed of both urban and rural parts. Information concerning the total population in rural and urban areas is available from the 1981 Census for each PSU as well as for each economic region (ER) in which explicit urban/rural stratification is not done. Comparison by ER with the actual 1981 rural or urban census counts indicates whether the selected PSUs over- or under-represent the respective areas. The ratio of actual rural-urban counts is divided by the corresponding estimates. These two factors are computed for each relevant ER at the time of selection of the PSUs and are entered on each sample record according to the appropriate area (rural or urban) of the NSRU. Changes in these factors are incorporated at the time of PSU rotations.

D.6 Subprovincial and Province-Age-Sex Adjustments

By applying the previously described four weighting factors, a valid estimate can be derived for any characteristic for which information is collected by the LFS. In particular, estimates are produced of the

total number of persons 15+ in provincial economic regions and the 24 large metropolitan areas as well as of designated age-sex groups in each of the ten provinces.

Independent estimates are available monthly for each of these classes from projections based upon the 1981 Census counts. By using an interactive 'raking ratio' adjustment procedure, the weights derived to this point are adjusted by a multiplying factor to correspond to the independent estimate for the various classes. This factor is the ratio of the independent estimate to the survey estimate based upon the first four weighting factors. The effect of this final adjustment is to insure that basic provincial and total population counts for economic regions, and that age/sex distribution data published from the LFS correspond to other Statistics Canada data sources as well as to increase the precision of all estimates derived from the LFS.

D.7

Weighting for the Labour Market Activity Survey

The principals behind the calculation of the weights for the LMAS are identical to those for the LFS. However, three adjustments are made to the LFS weights in order to derive a final weight for the individual records on the LMAS microdata files.

- (1) An adjustment to account for the use of a five-sixth sub-sample, instead of the full LFS sample.
- (2) An adjustment to account for the additional non-response to the LMAS i.e., non-response to the LMAS for households which do respond to the LFS or for which previous month's LFS data is brought forward.
- (3) A readjustment to account for independent province-age-sex projections, after the above adjustments are made.

Adjustments (1) and (2) are taken into account by multiplying the LFS sub-weight (i.e., the weight resulting from the first four LFS weighting factors) for each responding LMAS record by:

sum of LFS subweights of hhlds considered
responding to LFS

sum of LFS subweights of hhlds considered
responding to LMAS

INTRODUCTION

The Labour Market Activity Survey (LMAS) was conducted by Statistics Canada with the cooperation and support of Employment and Immigration Canada. This manual has been produced to facilitate the manipulation of the microdata files from the 1986 survey. Any questions about the data set or its use should be directed to:

2.

BACKGROUND

Since 1978, Statistics Canada has conducted the Annual Work Patterns Survey (AWPS) to provide information on the length and timing of periods of employment and unemployment in a calendar year. The AWPS was designed to complement the stock estimates obtained from the monthly Labour Force Survey (LFS) by providing flow estimates that are compatible and consistent with LFS concepts and definitions. The AWPS has been most useful in estimating the frequency and duration of labour market activities. However, the month-specific estimates of employment and unemployment have a high degree of error when compared to the monthly LFS. This is largely due to the month-specific activity-based recall methodology used by the AWPS.

In 1982, the AWPS was replaced by the Survey of 1981 Work History (SWH81). This survey was jointly sponsored by Labour Canada, Employment and Immigration Canada and Statistics Canada. The SWH81 was designed to yield information on the length and timing of periods of employment and the characteristics of all jobs held in 1981. Unlike the AWPS, no attempt was made in the SWH81 to account for time not working. The dual focus of the SWH81 on employment patterns and job characteristics lead to the use of an employer-specific methodology wherein data was collected on up to four jobs held with different employers.

Analysis revealed that this employer-specific approach yielded significantly more reliable estimates of employment than those obtained from the AWPS.

In 1984, a third survey, the Survey of Union Membership (SUM), was conducted by Statistics Canada on behalf of Labour Canada. The SUM was designed to provide estimates of selected job characteristics, such as union membership and wage rates for the current or most recently held paid job in 1984.

The Labour Market Activity Survey (LMAS) has been designed as a replacement for the AWPS. The 1986 questionnaire collects information on the annual work pattern of Canadians and characteristics of up to five jobs held in the 1986 calendar year.

Note: Copies of the questionnaires for the AWPS, the SWH81, and the SUM have been included in Appendix A.

3.

OBJECTIVES

The primary objectives of the Labour Market Activity Survey were:

- to provide measures of the dynamic nature of the Canadian labour market which are conceptually consistent with the Labour Force Survey;
- to provide information on the characteristics of paid jobs which are not available from the Labour Force Survey.

Secondary objectives of the survey were:

- to develop socio/economic/demographic profiles of "market segments" for specific programs offered by Employment and Immigration Canada;
- to identify participation in specific EIC programs.

4. CONCEPTS AND DEFINITIONS

The following section outlines the key concepts and definitions upon which the Labour Market Activity Survey is based. Users are referred to Appendix B of this document for copies of the actual survey forms used in the 1986 survey.

4.1 Work

In the LMAS, "work" refers to any duties performed for pay or profit, including unpaid work in a family farm or business. Pay includes cash payments and "payment in kind", whether or not the payment was received in the year the duties were performed. Work included any periods of paid leave, sabbatical, paid sick leave, etc. For the LMAS, the respondent must have worked at a job for at least one day during 1986 to be counted as having worked at sometime in the reference year.

4.2 Jobs and Job Change

One of the key constructs used in the LMAS is that of the job, where a job is defined in terms of usual duties performed at a usual wage or salary. In the LMAS, a job change occurred if the respondent changed their employer or experienced a change in both usual duties and usual wage or salary. The LMAS questionnaire collected detailed information on up to five different jobs held in the 1986 reference year. Where a respondent held more than five jobs in the reference year, detail was collected for the first five at which the respondent worked.

For each job identified in the LMAS, information is collected on the start date of the first spell of employment experienced in 1986 and the date most recently worked at the job, and, if applicable, the reason for leaving the job. In the terminology of the LMAS, the individual is said to have "held" the job between these two dates. In the LMAS, jobs could be held for as little as one day.

4.3 Employers

A second construct used by the LMAS is that of the employer. In this case, the definition used is identical to that used by the Labour Force Survey. Self-employed respondents who performed a variety of duties during their period of employment under the same company name would count as one employer. For self-employed persons with more than one business, each business was treated as a separate employer.

4.4 Work Interruptions

In the LMAS, a "work interruption" is an unpaid absence from a job for one week or more. Work interruptions must be followed by a return to the same job.

Reasons for work interruptions include temporary layoffs due to the seasonal nature of a job or temporary production/staff cut-backs, strikes, unpaid maternity leave, unpaid sick leave and the like.

If a respondent returned to work for the same employer and was engaged in the same job activities or duties as were performed before leaving the job, with or without a change in the usual wage or salary received by the respondent, the situation was considered a work interruption.

Persons with generic job descriptions who returned to work after an unpaid absence and who found themselves with the same general type of duties but not necessarily the same specific projects or co-workers were considered to have experienced a work interruption rather than having a new or different job.

If an employer continued to pay a respondent wages and salaries during an absence from or a stoppage of work, this period was not considered a work interruption. Examples are paid sick leave, paid vacation leave or any other paid leave of absence. Periods for which a respondent did not receive wages and salaries from the employer, but did receive compensation from other sources such as unemployment insurance, worker's compensation, disability insurance benefits, or government training allowances were treated as work interruptions.

If a respondent attended school, college or university while holding a job and during that time did not receive wages or salaries from the employer, the absence would be treated as a work interruption.

Since a work interruption is defined as an unpaid absence from a job, it is possible that multiple job holders (persons who had more than one job at a particular point in time) could be working at one job while experiencing a work interruption in a second.

4.5

Labour Force Status

The LMAS collected sufficient information to assign a labour force status of employed, unemployed, or not in the labour force to each week of the reference year. These labour force statuses were assigned using a hierarchical logic similar to that used in the monthly Labour Force Survey. Thus, weeks in which a respondent reported any work at any job were assigned a code of "employed". A code of "employed" was also assigned in a small number of weeks where no work was reported because the respondent's usual monthly work schedule at a job did not involve work in every week of the month.

If a code of "employed" could not be assigned in a given week, respondents were assigned a code of "unemployed (official definition)" if they were both looking for work and available for work, "unemployed (alternate definition)" if, in the absence of job search, they wanted work, or "not in the labour force" if the neither looked for nor wanted work.

4.6

Full-time/Part-time

In the LMAS, a job is classified as full-time if the usual monthly work schedule involved 120 or more hours, and part-time if the job would normally require less hours of work per month. Users should note that this differs considerably from the definition used in the monthly LFS, in which a respondent is classified as "full-time" if they usually work 30 or more hours per week at all jobs, and "part-time" if they usually work fewer hours. An equivalent of the LFS definition can be derived from LMAS data for a given week by summing the total hours worked per week ($Q.59 \times Q.60$) for all jobs at which the respondent worked in that week.

5. SURVEY DESIGN

Since the Labour Market Activity Survey was administered to a sub-sample of the LFS sample, its sample design is closely tied to that of the LFS. The LFS design is briefly described in Sections 5.1 to 5.4.¹ Section 5.5 describes how the LMAS departed from the basic LFS design.

5.1 Population Coverage

The LFS is a monthly household survey whose sample of individuals is representative of the civilian, non-institutionalized population 15 years of age or older in Canada's ten provinces. Specifically excluded from the survey's coverage are residents of the Yukon and Northwest Territories, persons living on Indian Reserves, full-time members of the Canadian Armed Forces and inmates of institutions. These groups together represent an exclusion of approximately 2% of the population aged 15 or over.

5.2 Sample Design

The LFS sample is based upon a stratified, multi-stage design employing probability sampling at all stages of the design. The design principles are the same for each province. A diagram summarizing the design stages is presented on page 11.

5.2.1 Primary Stratification

Provinces are first stratified into economic regions - geographic areas of more or less homogeneous economic structure formed on the basis of federal-provincial agreements and which are relatively stable over time.

1. A detailed description of the LFS design is available in the Statistics Canada publication entitled **Methodology of the Canadian Labour Survey, 1976** (catalogue #71-526). A description of the changes made to this design in 1985 can be found in "Post '81 Censal Redesign of the Canadian Labour Force Survey", **Survey Methodology**, December 1984 (catalogue #12-001, Vol 10, No. 2).

These economic regions are treated as primary strata and further stratification is carried out within them (see section 5.2.3).

5.2.2 Types of Areas

Economic regions are further disaggregated into 3 categories: self-representing areas (SRU's), non-self-representing areas (NSRU's) and special areas. Generally SRU's are urban areas whose population as of the 1981 Census exceeds 15,000 persons or whose unique labour force characteristics demand their establishment as SRU's. For the most part, SRU boundaries are coincident with delineations established for the Census.

All SRU's in each economic region are included in the survey and, as the name implies, each is represented by its own sample.

NSRU's are the areas lying outside the SRU's and they consist largely of small urban centres and rural areas. Each economic region contains one NSRU which is represented by its own sample.

A small proportion (approximately 1%) of the LFS population is found in institutions (for example, live-in staff of hospitals or schools or permanent residents of hotels or motels), on military bases (civilian personnel only) or in remote areas of provinces which are not readily accessible to LFS interviewers. For administrative purposes, this portion of the population is sampled separately through the special area frame. This portion of the sample is selected on a province-wide basis, without reference to the stratification used for SRU and NSRU areas.

5.2.3 Secondary Stratification

SRU areas are next individually delineated into design strata, which reflect areas of similar socio-economic status as identified in the 1981 Census. The extent of the stratification (i.e. number of strata) depends upon the size of the SRU.

In economic regions in which the NSRU population constitutes a significant proportion of the economic

region population, the NSRU is next delineated into separate urban and rural strata. Within each of these strata, further stratification is used to reflect differences on a number of labour force characteristics.

In special areas, strata are formed on a province-wide basis. The strata reflect the main types of special groups in the population which require special administrative sampling procedures. These are: military establishments, institutions and remote areas.

5.2.4 Cluster Delineation and Selection

Within each of the secondary strata found in SRU areas, a number of geographically contiguous groups of dwellings, or clusters, are formed based upon a combination of 1981 Census counts or field enumeration. These clusters generally are coincident with city blocks or block faces. The selection of a sample of clusters (generally 6 or 12 clusters) from each of these secondary strata represents the first stage of sampling in SRU areas.

Within each of the secondary strata in NSRU areas, a number of large geographic areas are delineated in such a way that each one reflects the composition of the stratum within which it is located with respect to a number of socio-economic characteristics. Two or four of these areas, known as primary sampling units (or PSU's) are selected into the sample from each secondary stratum. Within each selected PSU, a number of smaller geographically contiguous groups of dwellings, or clusters, are then formed using well-defined physical features which are recognizable both on maps and in the field.

In special areas, census enumeration areas (geographic areas covered by individual enumerators for the Census) represent the first stage of selection. Within those selected, where necessary, geographically contiguous groups of dwellings or clusters are formed and the selection of a sample of these represents the second stage of sampling.

5.2.5 Dwelling Selection

In all three types of areas (SRU, NSRU and special areas) selected clusters are first visited by enumerators in the field and a listing of all private dwellings in the cluster is prepared. From the listing a sample of 6 dwellings (on average) is then selected. This represents the final stage of sampling.

In the 17 largest SRU's, a sample of apartments in large apartment buildings is selected from a separate register based upon information supplied by CMHC. The purpose of this is to ensure better representation of apartment dwellers in the sample as well as to minimize the effect of growth in clusters, due to construction of new apartment buildings.

5.2.6 Person Selection

Demographic information is obtained for all persons for whom the selected dwelling is the usual place of residence. LFS information is obtained for all civilian household members 15 years of age or older.

LFS - SAMPLE DESIGN

At every stage of the sample design, probability sampling techniques are used to ensure that the sample is random yet representative of the intended survey population.

The sample design is similar for each province.

Each province consists of a number of economic regions - areas of similar economic structure formed on the basis of federal-provincial agreements.

Each economic region is divided into Self-Representing Units (SRU's), Non-Self-Representing Units (NSRU's) and Special Areas. SRU's are cities whose population exceeds 15,000 persons or whose unique characteristics demand their establishment as self-representing units. NSRU's are those areas lying outside the SRU's. Special Areas consist of military establishments, hospitals and other institutions and remote areas.

SRU's and NSRU's are delineated into Primary Sampling Units (PSU's) which are areas that can be conveniently visited by an interviewer. A sample of PSU's is selected.

Selected PSU's are then delineated into clusters of dwellings which correspond to blocks or block faces (in urban areas) and correspond to recognizable physical boundaries (in rural areas). A sample of the clusters is selected and all private dwellings in selected clusters are listed by field enumerators.

Within each selected cluster, a sample of dwellings is selected from the list of dwellings.

Within each selected dwelling, LFS information is obtained for each civilian household member 15 years of age or older.

5.3

Sample Size

The sample size of eligible persons in the LFS is determined so as to meet the statistical precision requirements specified for various labour force characteristics at the provincial and subprovincial level by federal, provincial and municipal governments as well as by a host of other data users.

The monthly LFS sample consists of approximately 53,500 dwellings. After excluding dwellings found to be vacant, dwellings demolished or converted to non-residential uses, dwellings containing ineligible persons, dwellings under construction, and seasonal dwellings, about 47,600 dwellings remain which are occupied by eligible persons. From these dwellings, LFS information is obtained for approximately 129,475 civilians aged 15 or over.

The distribution of approximate sample sizes by province is shown below.

Province	# of Dwellings	# of Households	# of Individuals
Newfoundland	3,050	2,625	8,900
Prince Edward Island	1,650	1,425	4,225
Nova Scotia	4,000	3,525	9,500
New Brunswick	3,950	3,525	9,850
Quebec	8,000	7,025	19,800
Ontario	10,100	9,200	24,950
Manitoba	4,050	3,700	9,450
Saskatchewan	5,450	4,875	12,225
Alberta	7,650	6,750	17,900
British Columbia	5,600	4,950	12,675
Total	53,500	47,600	129,475

5.4

Sample Rotation

The LFS employs a panel design whereby the entire monthly sample of dwellings can be considered to consist of 6 panels, or rotation groups, of approximately equal size. Each of these panels can be considered by itself to be representative of the entire LFS population. All dwellings in a rotation group remain in the LFS sample for 6 consecutive months after which time they are replaced (rotated out of the sample) by a new panel of dwellings selected from the same or similar clusters.

This rotation pattern was adopted to ensure that the sample of dwellings constantly reflects changes in the current housing stock and to minimize any problems of the non-response or respondent burden that would occur if households were to remain in the sample for longer than 6 months. It also has the statistical advantage of providing a common sample base for short-term month-to-month comparisons of LFS characteristics.

Because of the rotation group feature, it is possible to readily conduct supplementary surveys using the LFS design but employing less than the full size sample.

5.5

Sample Design Modifications for The Labour Market Activity Survey

The LMAS was based upon a sub-sample of the LFS design, being administered to a total of 5 of the 6 LFS rotation groups - 2 in January 1987 and another 3 in February 1987.

In addition to the usual LFS sample exclusions, the Labour Market Activity Survey was not administered to persons 15 years of age or persons 70 years of age or older to further minimize respondent burden within selected households.

Consequently, the surveyed population for the Labour Market Activity Survey is considered to consist of all civilian, non-institutionalized persons 16 to 69 years of age inclusive, who were residents of the ten provinces in January 1987. This encompasses 17,711,300 persons.

6. DATA COLLECTION

Data collection for the LFS is carried out each month during the week following the LFS reference week, usually the third week of the month.

6.1 Interviewing

Statistics Canada interviewers, who are part-time employees hired and trained specifically to carry out the LFS, contact each of the sampled dwellings to obtain the required labour force information. Each interviewer contacts approximately 70 dwellings per month.

Dwellings new to the sample are contacted through a personal visit. The interviewer first obtains socio-demographic information for each household member and then obtains labour force information for all eligible members. Provided there is a telephone in the dwelling and permission has been granted, subsequent interviews are conducted by telephone. As a result, approximately 85% of all dwellings are interviewed by telephone. In these subsequent month interviews, as they are called, the interviewer confirms the socio-demographic information collected in the first month and collects the labour force information for the current month.

In all dwellings, information about all household members is obtained from a knowledgeable household member - usually the person at home when the interviewer calls. Such 'proxy' reporting, which accounts for approximately 55% of the information collected, is used to avoid the high cost and extended time requirements that would be involved in repeat visits or calls necessary to obtain information directly from each respondent.

At the conclusion of the LFS monthly interviews, interviewers introduce the supplementary survey, if any, to be administered to some or all household members that month.

If during the course of the six months that a dwelling is in the sample, an entire household moves out and is replaced by a new household, information is obtained about the new household for the remainder of the six-month period.

6.2 Supervision and Control

All LFS interviewers are under the supervision of a staff of senior interviewers who are responsible for ensuring that interviewers are familiar with the concepts and procedures of the LFS and its many supplementary surveys and also for periodically monitoring their interviewers and reviewing their completed documents. The senior interviewers are in turn under the supervision of the LFS program managers, located in each of the 8 Statistics Canada regional offices.

6.3 Data Collection Modifications for The Labour Market Activity Survey

Given the nature and extent of the information being sought by the LMAS, three modifications to the standard LFS collection strategy were effected:

- (i) LFS data release schedules require that all interviewing for the LFS be completed in one week. Normally, information for LFS supplementary surveys is collected immediately following the LFS interview. In the case of the LMAS the data collection period was extended two weeks beyond the normal LFS cut-off in January and again in February to ensure that the collection of the regular LFS data was not delayed.
- (ii) The LFS practice of collecting information for all household members through proxy interview with one knowledgeable and responsible member was modified to allow more information to be collected directly from the individual concerned. 61% of LMAS respondents were interviewed directly.
- (iii) LMAS interviews were not conducted in dwellings that had experienced a complete turnover in household membership since the previous month. This was done to avoid the response burden that would have been imposed on such households by first requiring completion of the household membership and demographic information, followed by the labour force information required for the LFS, followed finally by the LMAS information.

This procedure resulted in a reduction to the LMAS sample of 788 households nationally, or 1.8% of the total sample of 44,560 dwellings.

6.4

Non-Response

Interviewers are instructed to make all reasonable attempts to obtain LFS interviews with members of eligible households. For individuals who at first refuse to participate in the survey, a letter is sent from the Regional Office to the dwelling address stressing the importance of the survey and the household's cooperation. This is followed by a second call (or visit) from the interviewer. For cases in which the timing of the interviewer's call (or visit) is inconvenient, an appointment to call back at a more convenient time is set up. For cases in which there is no one home, numerous call backs are made. Under no circumstances are sampled dwellings replaced by other dwellings for reasons of non-response.

Each month, even after all attempts to obtain interviews have been made, a small number of non-responding households remain. For households non-responding to the LFS and for which LFS information was obtained in the previous month, this information is brought forward and used as the current month's LFS information.

The LFS response rate is defined as the households responding to the survey expressed as a percentage of all eligible households that should have responded (i.e., after the exclusion of out-of-scope or ineligible dwellings). In January 1987, a 96.1% response rate was achieved by the LFS and in February 1987, a 95.6% response rate was achieved by the LFS.

For the 5 rotation groups used by the LMAS Survey, the LFS recorded a total of 44,560 sample dwellings of which 39,578 were in-scope (i.e., contained eligible households). Of these, 38,061 responded, resulting in a household response rate of 96.2%. For the 5 rotation groups and the age range used by the LMAS survey, 74,065 individual interviews were obtained by the LFS (including cases of non-response for which data was brought forward from previous months) and 66,934 were obtained for the LMAS and are on the person level microdata file.

The disposition of sample cases by province (both dwellings and individuals) is presented in Appendix C.

Specifications for Mapping
4 Digit Standard Occupation
Codes into 49 Groups

Mapping of 4 Digit SOC Codes into 49 Groups

1980 SOC CODE RANGE	GROUPED CODE	SOC DESCRIPTION
111	01	officials & administrators, Gov't
113-114	02	other managers & administrators
117	03	management & administration related
211-213	04	physical, life science
218	05	maths, stats, systems analysis, rel
214-215	06	architects and engineers
216	07	architecture & engineering related
231, 233-235, 239	08	social sciences and related
251	09	religion
271	10	university and related
273	11	elementary, secondary and related
279	12	other teaching and related
311	13	health diagnosing and treating
313	14	nursing, therapy and related
315-316	15	medicine and health related
331, 333, 335-337	16	artistic and recreational
411	17	stenographic and typing
413	18	bookkeeping, accountrecording & rel
414	19	office machine and E.D.P. operators
415	20	material recording, scheduling and distributing
417	21	reception, inf., mail & message distribution
416, 419	22	library, file, correspondence, other clerical and related
513-514	23	sales, commodities
517, 519	24	sales, services and other sales
611	25	protective service
612-613	26	food & bev. preparation and related lodging and accommodation
614, 616	27	personal, apparel & furnishing serv
619	28	other service occupations
711, 713	29	farmers (& farm mngmnt. - 1970 only
718-719	30	other framing, horticultural and animal husbandry
731	31	fishing, hunting, trapping and related
751	32	forestry and logging
771	33	mining & quarrying including gas and oil field
821-822	34	food, beverage and related

Mapping of 4 Digit SOC Codes into 49 Groups (con't)

1980 SOC CODE RANGE	GROUPED CODE	SOC DESCRIPTION
823, 825-827, 829 813-817, 811	35	other processing occupations
833	36	metal shaping & forming occupations
839, 835, 837, 831	37	other machining occupations
851-852	38	metal products, N.E.C.
853	39	electrical, electronic and related equipment
855-856	40	textiles, furs & leather goods
854, 857, 859	41	wood products, rubber, plastics and other related
858	42	mechanics & repairmen, except electrical
871	43	excavation, grading, paving & rel
873	44	electrical power, lighting & wire communications equipment, erecting, installing & repairing
878-879	45	other construction trades
917	46	motor transport operators
911, 913, 915, 919	47	other transportation equipment operators
931	48	material handling
959, 951, 953, 955	49	other crafts & equipment operators

Note: For definition of detailed 1980 SOC codes, see "Standard Occupational Classification, Statistics Canada, February 1981, Catalogue 12-565.

NOTES:

- (1) SAMPLING VARIABILITIES (COEFFICIENTS OF VARIATION) ARE IN PERCENTS. 0000000
- (2) TO DETERMINE SAMPLING VARIABILITIES FOR ESTIMATES OF TOTALS, LOCATE 0000000
THE ROM CLOSEST TO THE ESTIMATED TOTAL. THE LEFT-MOST COLUMN GIVES 0000000
THE SAMPLING VARIABILITY. 0000000
- (3) TO DETERMINE SAMPLING VARIABILITIES FOR ESTIMATES OF PERCENTAGES, 0000000
USE THE ROM CLOSEST TO THE NUMERATOR OF THE PERCENTAGE AND THE 0000000
COLUMN CLOSEST TO THE PERCENTAGE. 0000000
- (4) SAMPLING VARIABILITIES IN THIS TABLE ARE CRUDE INDICATORS AND IN 0000000
GENERAL ARE HIGHER THAN THOSE THAT WOULD BE OBTAINED USING MORE 0000000
EXACT TECHNIQUES. UNDER NO CIRCUMSTANCES ARE THEY OFFICIAL. 0000000

NOTES:

- (1) SAMPLING VARIABILITIES (COEFFICIENTS OF VARIATION) ARE IN PERCENTS. 0000000
- (2) TO DETERMINE SAMPLING VARIABILITIES FOR ESTIMATES OF TOTALS, LOCATE THE ROM CLOSEST TO THE ESTIMATED TOTAL. THE LEFT-MOST COLUMN GIVES THE SAMPLING VARIABILITY. 0000000
- (3) TO DETERMINE SAMPLING VARIABILITIES FOR ESTIMATES OF PERCENTAGES, USE THE ROM CLOSEST TO THE NUMERATOR OF THE PERCENTAGE AND THE COLUMN CLOSEST TO THE PERCENTAGE. 0000000
- (4) SAMPLING VARIABILITIES IN THIS TABLE ARE CRUDE INDICATORS AND IN GENERAL ARE HIGHER THAN THOSE THAT WOULD BE OBTAINED USING MORE EXACT TECHNIQUES. UNDER NO CIRCUMSTANCES ARE THEY OFFICIAL. 0000000

NOTES:

- (1) SAMPLING VARIABILITIES (COEFFICIENTS OF VARIATION) ARE IN PERCENTS. 0000000
- (2) TO DETERMINE SAMPLING VARIABILITIES FOR ESTIMATES OF TOTALS, LOCATE THE ROM CLOSEST TO THE ESTIMATED TOTAL. THE LEFT-MOST COLUMN GIVES THE SAMPLING VARIABILITY. 0000000
- (3) TO DETERMINE SAMPLING VARIABILITIES FOR ESTIMATES OF PERCENTAGES, USE THE ROM CLOSEST TO THE NUMERATOR OF THE PERCENTAGE AND THE COLUMN CLOSEST TO THE PERCENTAGE. 0000000
- (4) SAMPLING VARIABILITIES IN THIS TABLE ARE CRUDE INDICATORS AND IN GENERAL ARE HIGHER THAN THOSE THAT WOULD BE OBTAINED USING MORE EXACT TECHNIQUES. UNDER NO CIRCUMSTANCES ARE THEY OFFICIAL. 0000000

APPENDIX K

Publications

PUBLICATIONS

In addition to the microdata tapes, information from the LMAS will be released through a series of publications and studies. A set of general interest profiles will be published annually, and a series of evaluations will be prepared annually and made available on request. Besides these standard products, users may request custom tabulations to meet their specific requirements.

The set of general interest profiles are intended to acquaint users with the unique analytic potential of the LMAS. These publications will provide information on a wide range of variables collected by the survey. All the tables produced for these publications will be available for purchase on diskette. For microdata tape purchases, these tables may serve as a source of control totals for detailed province-sex-age groups.

Nine general interest profiles are published annually. The first set of profiles contain information pertaining to the 1986 calendar year. The titles of these publications are as follows:

Canada's Women:

A 1986 Profile of their Labour Market Experiences
(Statistics Canada, Catalogue No. 71-205)

Canada's Men:

A 1986 Profile of their Labour Market Experiences
(Statistics Canada, Catalogue No. 71-206)

Canada's Youth:

A 1986 Profile of their Labour Market Experiences
(Statistics Canada, Catalogue No. 71-207)

Canada's Older Workers

A 1986 Profile of their Labour Market Experiences
(Statistics Canada, Catalogue No. 71-208)

Canada's Unionized Workers:

A 1986 Profile of their Labour Market Experiences
(Statistics Canada, Catalogue No. 71-)

Canada's Part-time Workers

A 1986 Profile of their Labour Market Experiences
(Statistics Canada, Catalogue No. 71-209)

Canadian Wage Rates by Industry and Occupation: 1986
(Statistics Canada, Catalogue No. 71-210)

Low Wage Earners in Canada

A 1986 Profile of their Labour Market Experiences
(Statistics Canada, Catalogue No. 71-211)

Pension Plan Coverage in 1986
A 1986 Profile of Participants Labour Market
Experiences

An important aspect of the LMAS is the evaluation or certification of the data derived from the survey. The evaluation exercise provides a comparison of the LMAS data to similar data derived from other sources. These comparisons are prepared annually and made available on request. Currently, four evaluation studies are planned.

Employment in 1986:
An Evaluation of Labour Market Activity Survey Results

Unemployment in 1986:
An Evaluation of Labour Market Activity Survey Results

Earnings in 1986:
An Evaluation of Labour Market Activity Survey Results

Wage Rates in 1986:
An Evaluation of Labour Market Activity Survey Results
